NWEA MAP ASG TEACHER DASHBOARD

User guide

How to get your files out of NWEA, what every number means, what each section of the dashboard tells you, and what to do about it before the next data conversation.

Built from the dashboard itself, using its own sample data, so the pictures and the section text are the same ones you see on screen. Every section on the page also carries a **?** in its corner that says the same in three short answers.

Your file never leaves your computer. The dashboard reads it in your browser, loads nothing from the internet, and stores nothing about your students.

8 When something looks wrong

A Glossary and reference tables

1. What this tool is, and what it never does

The dashboard turns an NWEA MAP Growth export into a classroom planning view: who grew, who needs support, who closed a gap, how to group the class, what to say at a data meeting and what to put on the wall. It is one web page. Open it, drop your CSV on it, and everything you see is computed from that file in your own browser.

> **PRIVACY**
> Nothing is uploaded anywhere. The page loads no third-party scripts, fonts or trackers, so it also works offline and behind a school filter. The only things remembered between visits are your theme and motion preferences; no student data is ever written to disk or sent to a server. Closing the tab forgets the file.

It is built for teachers rather than analysts. Three habits run through every section:

- **It says when a number is too thin to trust.** Any share resting on fewer than 10 records is shown as a count ("3 of 4") rather than a percentage, because a percentage over a handful of students is one child rounded to a whole number.
- **It separates achievement from growth.** Where a score sits is one question; how far it moved compared with students who started in the same place is another. High achievement can hide low growth, and a low start can hide strong growth.
- **It explains itself.** Method notes sit under the figures they qualify, and the **?** in the corner of every section opens a short explanation in place.

Two words it uses precisely: a **record** is one student in one subject, so a student tested in three subjects is three records; a **student** is a person. Most figures count records, and the page says which.

2. Getting your files out of NWEA MAP

You need two kinds of export for the whole picture, and they have to match. The **Achievement Status and Growth (ASG)** report carries growth: where each student started, where they are now, and NWEA's projection. The **Class Profile** report carries the instructional areas inside each subject, one file per subject. Load both and the dashboard folds each student's two records into one.

The Achievement Status and Growth (ASG) export

1. Sign in to MAP Growth and open *MAP Reports*.
2. Choose the *Achievement Status and Growth* report for your class and the two terms you want compared (for example Fall to Spring).
3. Use the export or download option and choose *CSV*.
4. Save the file somewhere you can find it. You do not need to open or edit it.

The Class Profile exports

1. In *MAP Reports*, choose the *Class Profile* report for the same class and the current term.
2. Run it once per subject - mathematics, reading, language usage, science - and download each as *CSV*. Each file is one test.
3. Keep them with the ASG file. You will upload all of them together.

> **GET BOTH RIGHT**
>
> Same class, same term, every student in both. The dashboard matches each student's ASG record to their Class Profile record by student ID and subject. If the two exports disagree about a student's score - the same test with two different results - the Data Check names the student, both figures and both files, and keeps the growth record. Check the exports rather than trust either number for that student.

Column names are matched automatically, so slightly different exports still work, and comma, semicolon and tab separated files are all read. Suppressed values (the asterisks NWEA prints for small groups) and missing scores are handled.

A fall upload with one test window

In September there is nothing to compare against yet. Upload the single-window export anyway: the dashboard detects it and switches to a start-of-year view with tiers, norm placement and growth targets instead of showing empty growth panels. It does not matter whether the export puts the fall test in the Start or the End columns.

Several files at once

Select all the files at once when you upload and they are read as one data set. Where an ASG file and a Class Profile file describe the same test, the two are folded into one record so growth and instructional areas sit on the same student. An ASG file on its own gives you everything except the instructional areas; Class Profile files on their own give you the areas and one window, but no growth.

Only Growth tests are read. A Class Profile also lists any screening test a student sat (its TestName starts with “Screening” rather than “Growth”); those rows are left out entirely, so a screener can never replace or

merge into a student's growth test. The Data Check names each one that was left out.

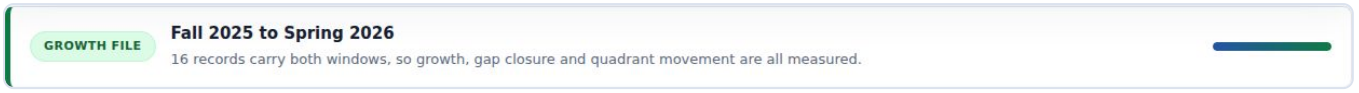

> **NOT READY TO EXPORT?**
>
> Click *Load Sample Data* on the upload panel to explore every feature with a small made-up class first. Everything in this guide was pictured with that sample.

3. Loading a file and choosing what you look at

The upload panel. Drag files onto the dashed box or click it to browse.

Drop your CSV on the upload box, or click it and choose the file. Once a file is loaded the panel shrinks to a status line with the record and student counts; *Change file* brings it back. The banner below the panel says what kind of file it is:

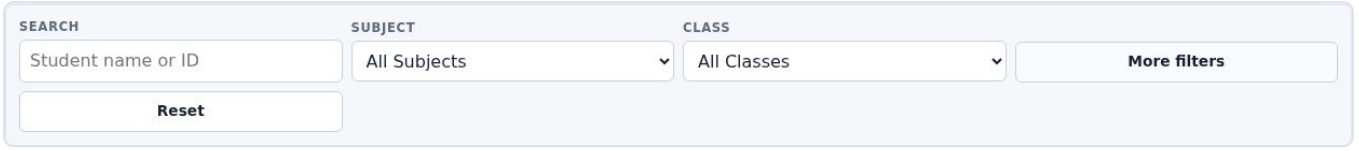

A growth file: two windows, so growth, gap closure and quadrant movement are all measured.

A single-window file: the dashboard says why no growth figure appears and analyses the window it has.

- **Growth file** - most records carry both windows. Everything is available.
- **Mixed file** - a growth file where a meaningful share of records only have the current window, usually students who joined after the earlier test. Growth panels describe the records with a prior score; the others are read from the achievement and norm columns.
- **Baseline file** - one window only. Growth, gap closure and quadrant panels are hidden rather than shown empty; the Starting Point section, tiers, norm placement and targets take their place.

Filters

The filter bar. On a tall screen it stays at the top of the page as you scroll; on a laptop screen it scrolls away, and the Filters chip in the Jump to bar leads back to it.

Every section, card, poster and export follows the filters. Search by student name or ID; narrow to a subject or a class; *More filters* adds teacher, grade, band, met growth, planning group, gap status and tier, and a switch between the subject lens and the class lens for the overview cards. When the export marks a test as not valid, a tick box lets you put those records back. *Reset* clears everything.

The quick-question chips at the top jump straight to the section that answers them, and the *Jump to* bar lists every section the file makes available. It stays pinned at the top of the screen as you scroll, so any section is one click away, and it marks the section you are reading. On a laptop screen the filters scroll away and the bar keeps a *Filters* chip that shows how many are set and takes you back to them.

4. Reading the numbers

RIT score

NWEA's equal-interval scale, roughly 140 to 260, running through every year of school without restarting. Growth is measured in RIT points. It is the number to quote when you talk about progress.

Percentile

Where a RIT sits against students in the same grade nationally, out of 100; 50 is the middle. It is not the share of questions answered correctly.

Colour bands and tiers

Percentiles are grouped into five bands twenty points wide, and the same cut points give the instructional tiers used for planning. A band is where a student is today, not a label.

Projected and observed growth

NWEA projects, from each student's own starting RIT and grade, how much a typical peer grows between the two windows. Observed growth is what happened. *Met growth* means observed was at least the projection; *exceeded* means more.

Conditional growth percentile (CGP)

A student's growth ranked against students nationally who started at the same RIT and grade. 50 is typical growth from that start, which makes it fair to low and high starters alike. Above 50 is faster than typical.

US norms and grade-level equivalence

The mean RIT for each grade and season in NWEA's norms study, built into the page as a reference table. "vs US norm" is the distance from that mean; the grade level is read strictly from those means - the highest grade whose typical score, in that season, the student's score has reached - so a Grade 5 student under the typical Grade 5 score is placed in Grade 4 and shown that way. It is not a reading or maths grade level. The page does not flag or group a student as behind for a shortfall of 3 RIT or less, which is inside measurement error. When a file says it was scored against a different norms study, the Data Check says so and the RIT-versus-norm figures should be read with care.

The secure benchmark

The 61st percentile is a locally chosen line for "secure", not an NWEA definition. The 41st is the on-track line, the 21st the top of the intensive tier, the 81st the start of advanced. Gap closure measures movement towards or past the 61st among students who started below it.

Counts instead of percentages

Under 10 records a figure prints as a count. Widen the filters, or read the counts as counts; they carry the same fact without implying a precision the denominator cannot support.

Too close to call

Where the export carries a standard error, a met-growth result that sits within measurement error of the projection is marked "too close": the test pair cannot resolve it either way, and it is neither a miss to chase nor a win to celebrate.

BAND	PERCENTILE
Red	0 to 20
Orange	21 to 40

TIER	LEVEL	RANGE
Intensive	Tier 3	At or below the 20th percentile
Strategic	Tier 2	21st to 40th percentile

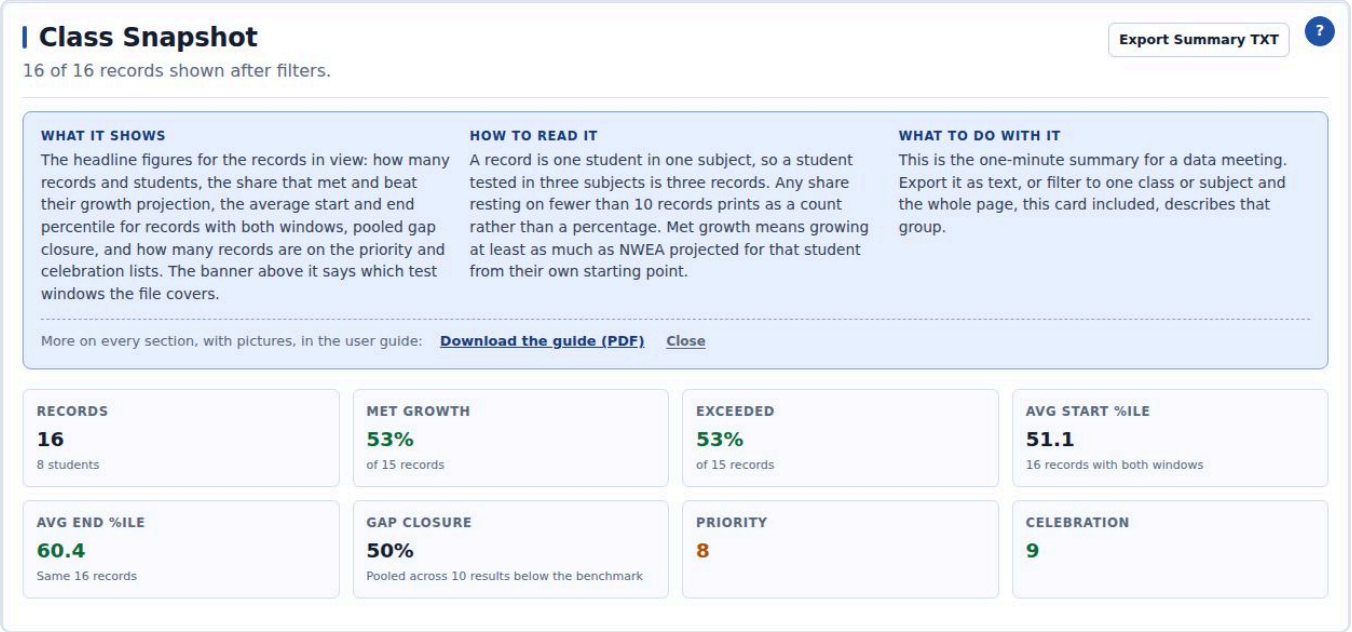

BAND	PERCENTILE
Yellow	41 to 60
Green	61 to 80
Blue	81 to 100

TIER	LEVEL	RANGE
On Track	Tier 1	41st to 60th percentile
Secure	Tier 1	61st to 80th percentile
Advanced	Extend	81st percentile and above

5. The sections, one by one

Each entry below is the text behind the section's **?** button: what it shows, how to read it, and what to do with it. Sections that mean something different on a single-window file say so.

5.1 Class Snapshot

Class Snapshot, shown with the sample data.

WHAT IT SHOWS

The headline figures for the records in view: how many records and students, the share that met and beat their growth projection, the average start and end percentile for records with both windows, pooled gap closure, and how many records are on the priority and celebration lists. The banner above it says which test windows the file covers.

HOW TO READ IT

A record is one student in one subject, so a student tested in three subjects is three records. Any share resting on fewer than 10 records prints as a count rather than a percentage. Met growth means growing at least as much as NWEA projected for that student from their own starting point.

WHAT TO DO WITH IT

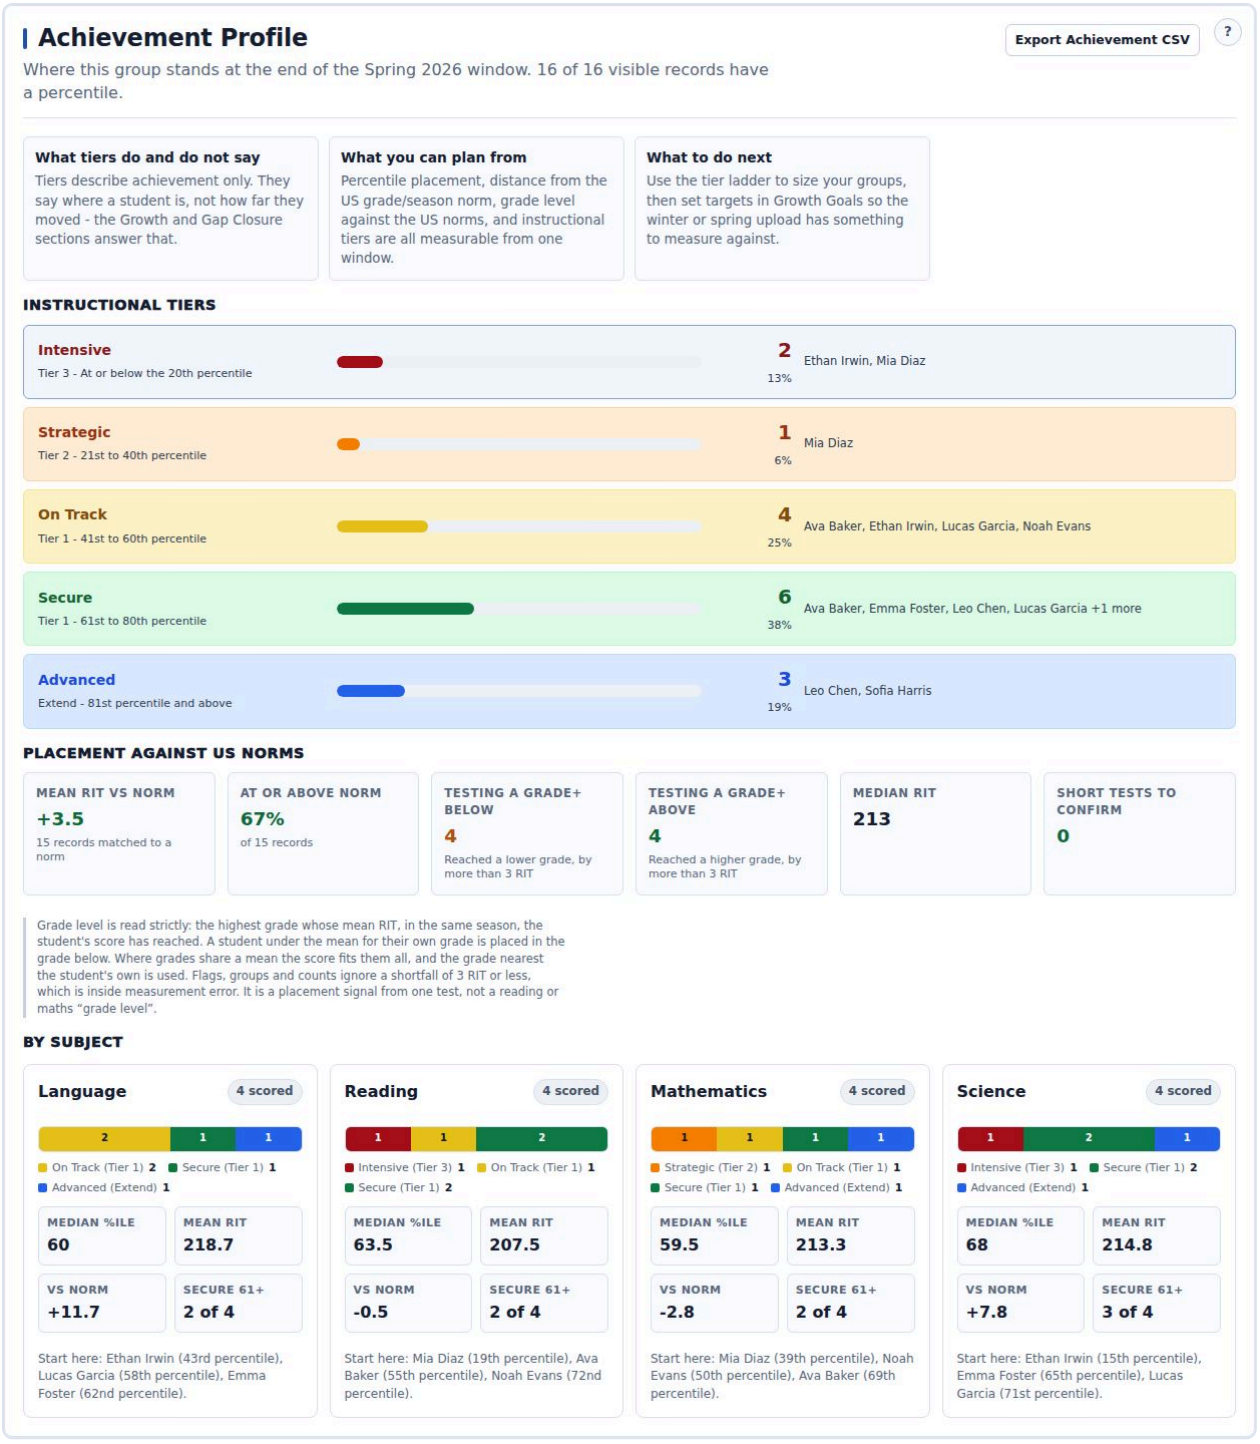

This is the one-minute summary for a data meeting. Export it as text, or filter to one class or subject and the whole page, this card included, describes that group.

ON A SINGLE-WINDOW FILE

The headline figures for a single-window file: students and records, the median percentile, the mean RIT, distance from the US norm mean, the share at or above the norm and at or above the secure line, and how many records start in Tier 2 or 3. The banner explains why no growth figure appears.

Nothing here measures movement: with one test window there is no earlier score to compare against. A share resting on fewer than 10 records prints as a count.

5.2 Achievement Profile (called Starting Point on a single-window file)

Achievement Profile, shown with the sample data.

WHAT IT SHOWS

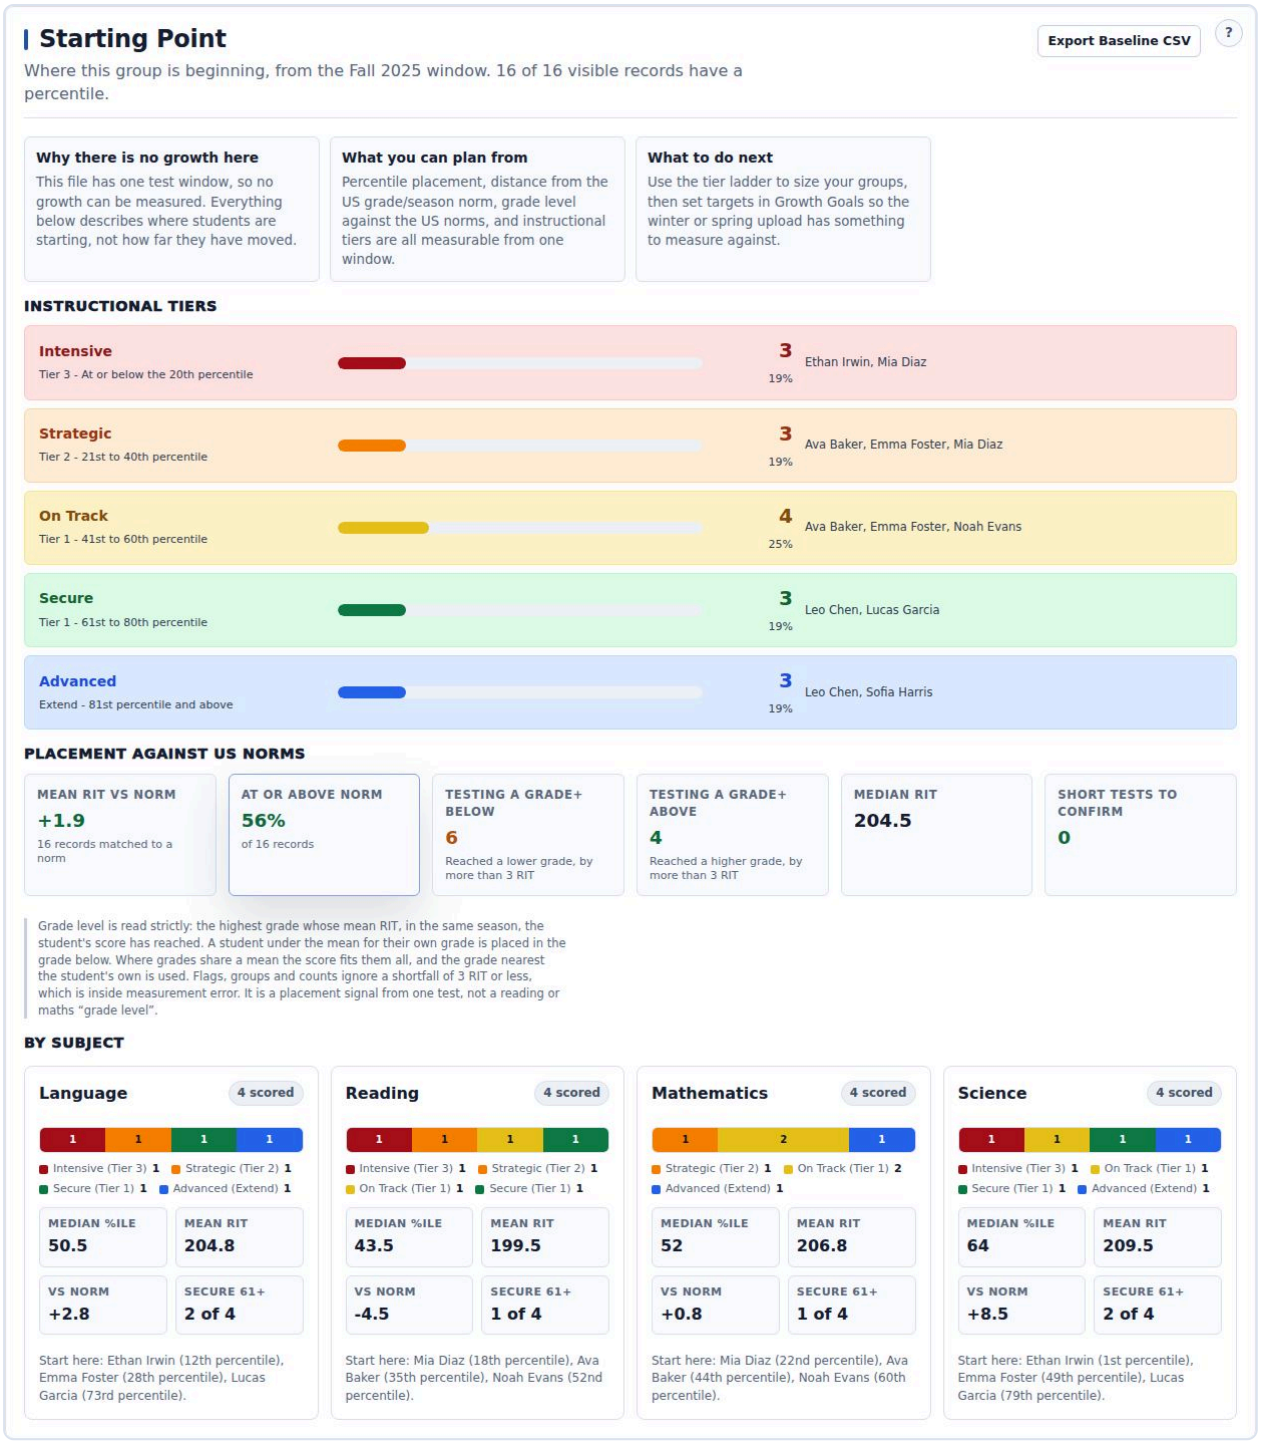

The instructional tier ladder for the current window (Intensive at or below the 20th percentile, Strategic 21st to 40th, On Track 41st to 60th, Secure 61st to 80th, Advanced 81st and above), placement against the US grade and season norms, and a breakdown by subject or class.

HOW TO READ IT

Tiers describe achievement only: where a student is, not how far they moved. The grade level is read strictly from grade-mean RIT scores: the highest grade whose typical score the student has reached, so a student under the typical score for their own grade is placed in the grade below. It is not a reading or maths grade level, and a shortfall of 3 RIT or less is not flagged as behind.

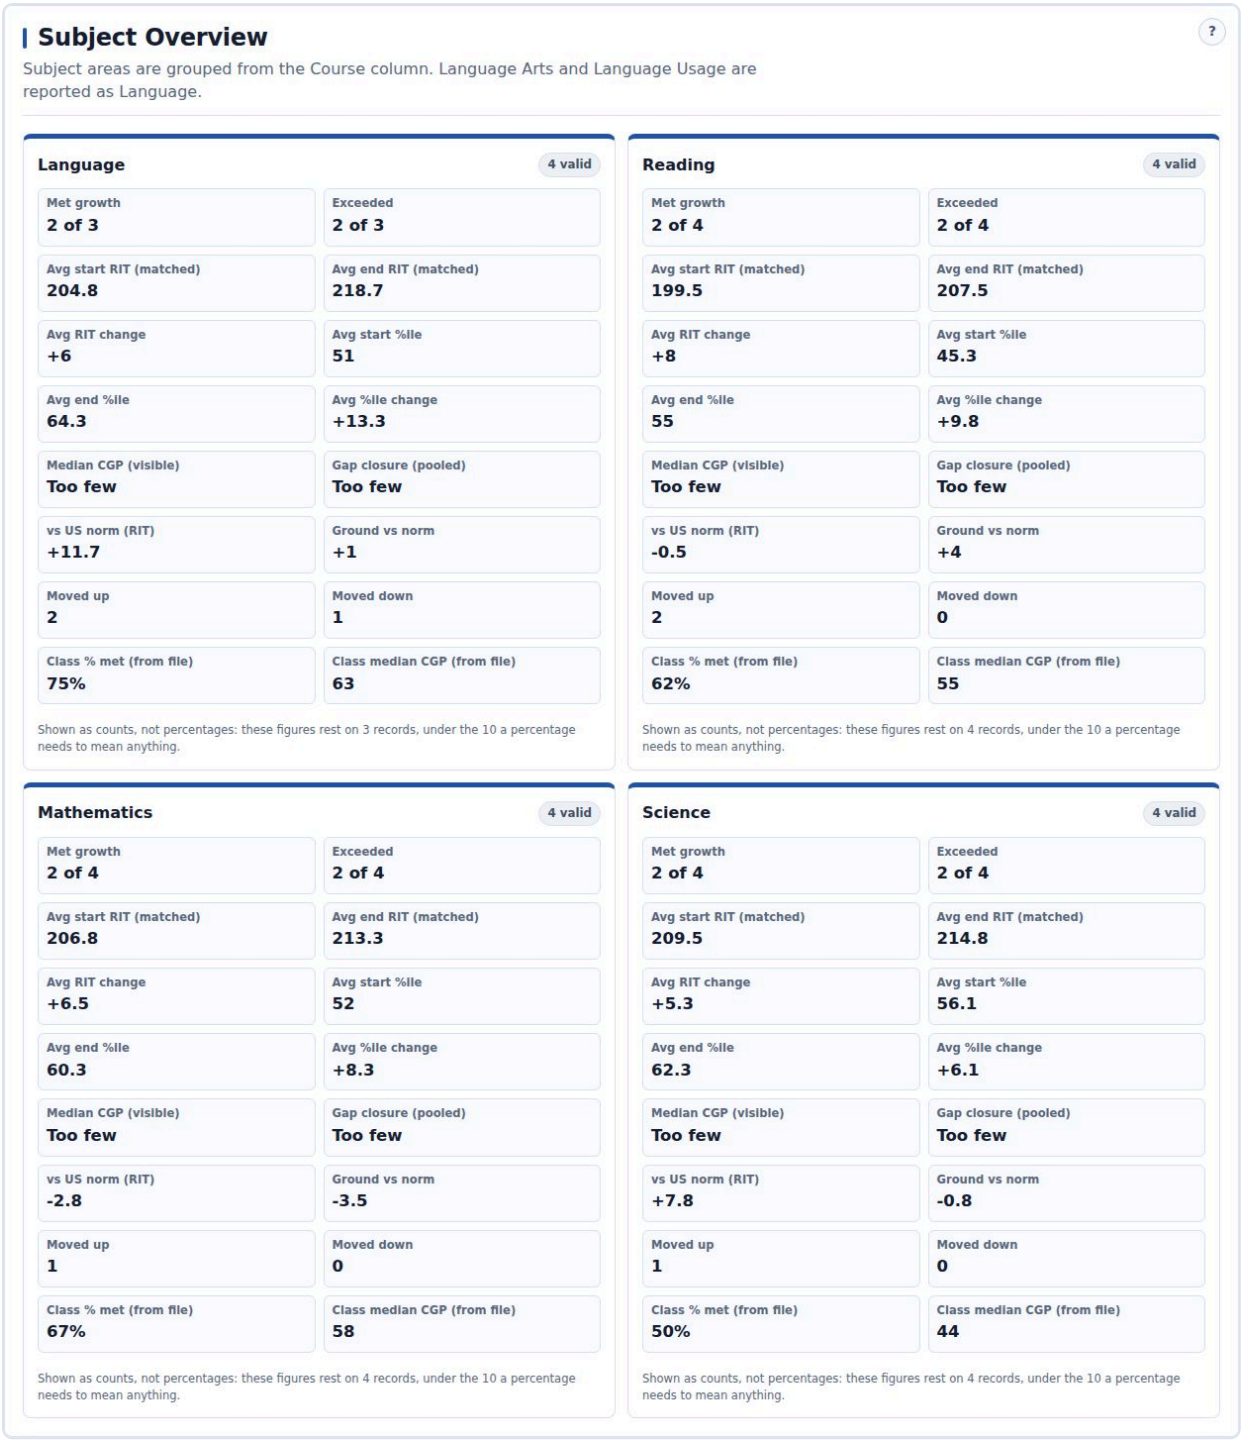

WHAT TO DO WITH IT

Click a tier row to filter the whole page to that tier. Use the counts to size intervention and extension groups before the timetable is fixed.

The same section on a fall file, where it is called Starting Point.

5.3 Subject Overview

Subject Overview

Subject areas are grouped from the Course column. Language Arts and Language Usage are reported as Language.

Language — 4 valid

Met growth: 2 of 3	Exceeded: 2 of 3
Avg start RIT (matched): 204.8	Avg end RIT (matched): 218.7
Avg RIT change: +6	Avg start %ile: 51
Avg end %ile: 64.3	Avg %ile change: +13.3
Median CGP (visible): Too few	Gap closure (pooled): Too few
vs US norm (RIT): +11.7	Ground vs norm: +1
Moved up: 2	Moved down: 1
Class % met (from file): 75%	Class median CGP (from file): 63

Shown as counts, not percentages: these figures rest on 3 records, under the 10 a percentage needs to mean anything.

Reading — 4 valid

Met growth: 2 of 4	Exceeded: 2 of 4
Avg start RIT (matched): 199.5	Avg end RIT (matched): 207.5
Avg RIT change: +8	Avg start %ile: 45.3
Avg end %ile: 55	Avg %ile change: +9.8
Median CGP (visible): Too few	Gap closure (pooled): Too few
vs US norm (RIT): -0.5	Ground vs norm: +4
Moved up: 2	Moved down: 0
Class % met (from file): 62%	Class median CGP (from file): 55

Shown as counts, not percentages: these figures rest on 4 records, under the 10 a percentage needs to mean anything.

Mathematics — 4 valid

Met growth: 2 of 4	Exceeded: 2 of 4
Avg start RIT (matched): 206.8	Avg end RIT (matched): 213.3
Avg RIT change: +6.5	Avg start %ile: 52
Avg end %ile: 60.3	Avg %ile change: +8.3
Median CGP (visible): Too few	Gap closure (pooled): Too few
vs US norm (RIT): -2.8	Ground vs norm: -3.5
Moved up: 1	Moved down: 0
Class % met (from file): 67%	Class median CGP (from file): 58

Shown as counts, not percentages: these figures rest on 4 records, under the 10 a percentage needs to mean anything.

Science — 4 valid

Met growth: 2 of 4	Exceeded: 2 of 4
Avg start RIT (matched): 209.5	Avg end RIT (matched): 214.8
Avg RIT change: +5.3	Avg start %ile: 56.1
Avg end %ile: 62.3	Avg %ile change: +6.1
Median CGP (visible): Too few	Gap closure (pooled): Too few
vs US norm (RIT): +7.8	Ground vs norm: -0.8
Moved up: 1	Moved down: 0
Class % met (from file): 50%	Class median CGP (from file): 44

Shown as counts, not percentages: these figures rest on 4 records, under the 10 a percentage needs to mean anything.

Subject Overview, shown with the sample data.

WHAT IT SHOWS

One card per subject with its key figures: records, averages or medians, the shares that met growth or sit above the norm, band movement and ground gained against the norm. The lens switch turns it into one card per class instead.

HOW TO READ IT

Compare cards, not students. Where a card shows a count instead of a percentage, it rests on fewer than 10 records and the comparison is a description of this file rather than a finding. The class lens compares groups inside one upload, which is not a national comparison.

WHAT TO DO WITH IT

Find the subject that needs attention first, or switch the lens to class and see how the groups in the file sit next to each other.

5.4 Subject Charts

Subject Charts, shown with the sample data. (The top of the section; it continues below on screen.)

WHAT IT SHOWS

For each subject: start and end achievement, projected against observed growth, met and exceeded rates, and the distribution across the five colour bands.

HOW TO READ IT

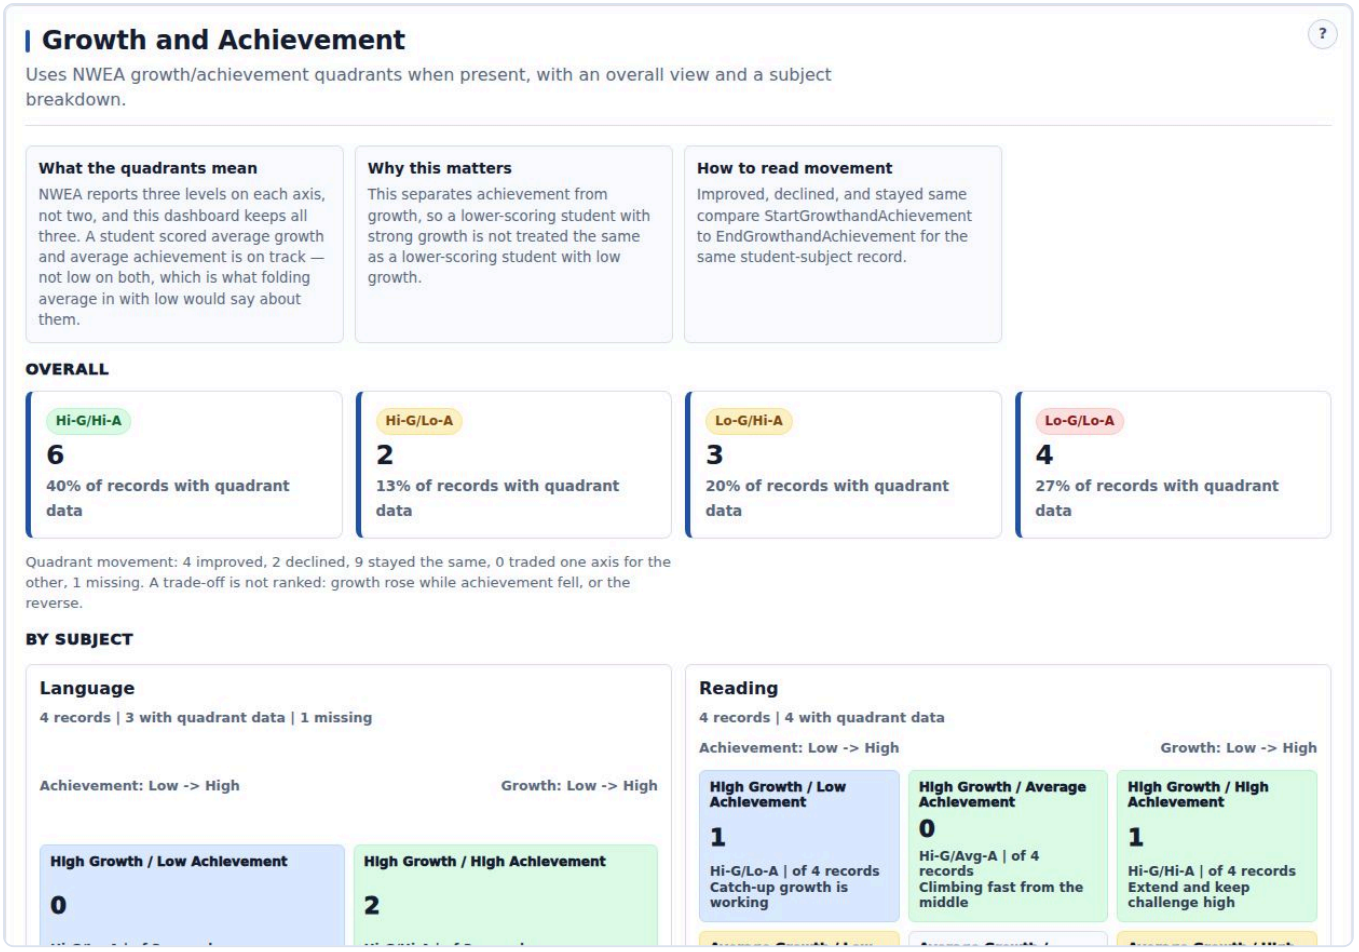

Bars start at zero, so lengths compare fairly. Thin data is drawn from counts, and the same rule applies: fewer than 10 records is a handful of children, not a rate.

WHAT TO DO WITH IT

Use them in a team meeting where a picture is quicker than a table, and print the page when the meeting is on paper.

5.5 Growth and Achievement

Growth files only: this section is hidden when the export carries a single test window.

Growth and Achievement, shown with the sample data. (The top of the section; it continues below on screen.)

WHAT IT SHOWS

NWEA's growth and achievement quadrants for the end window, the movement between quadrants since the start window, a scatter of every record, and median conditional growth by starting band.

HOW TO READ IT

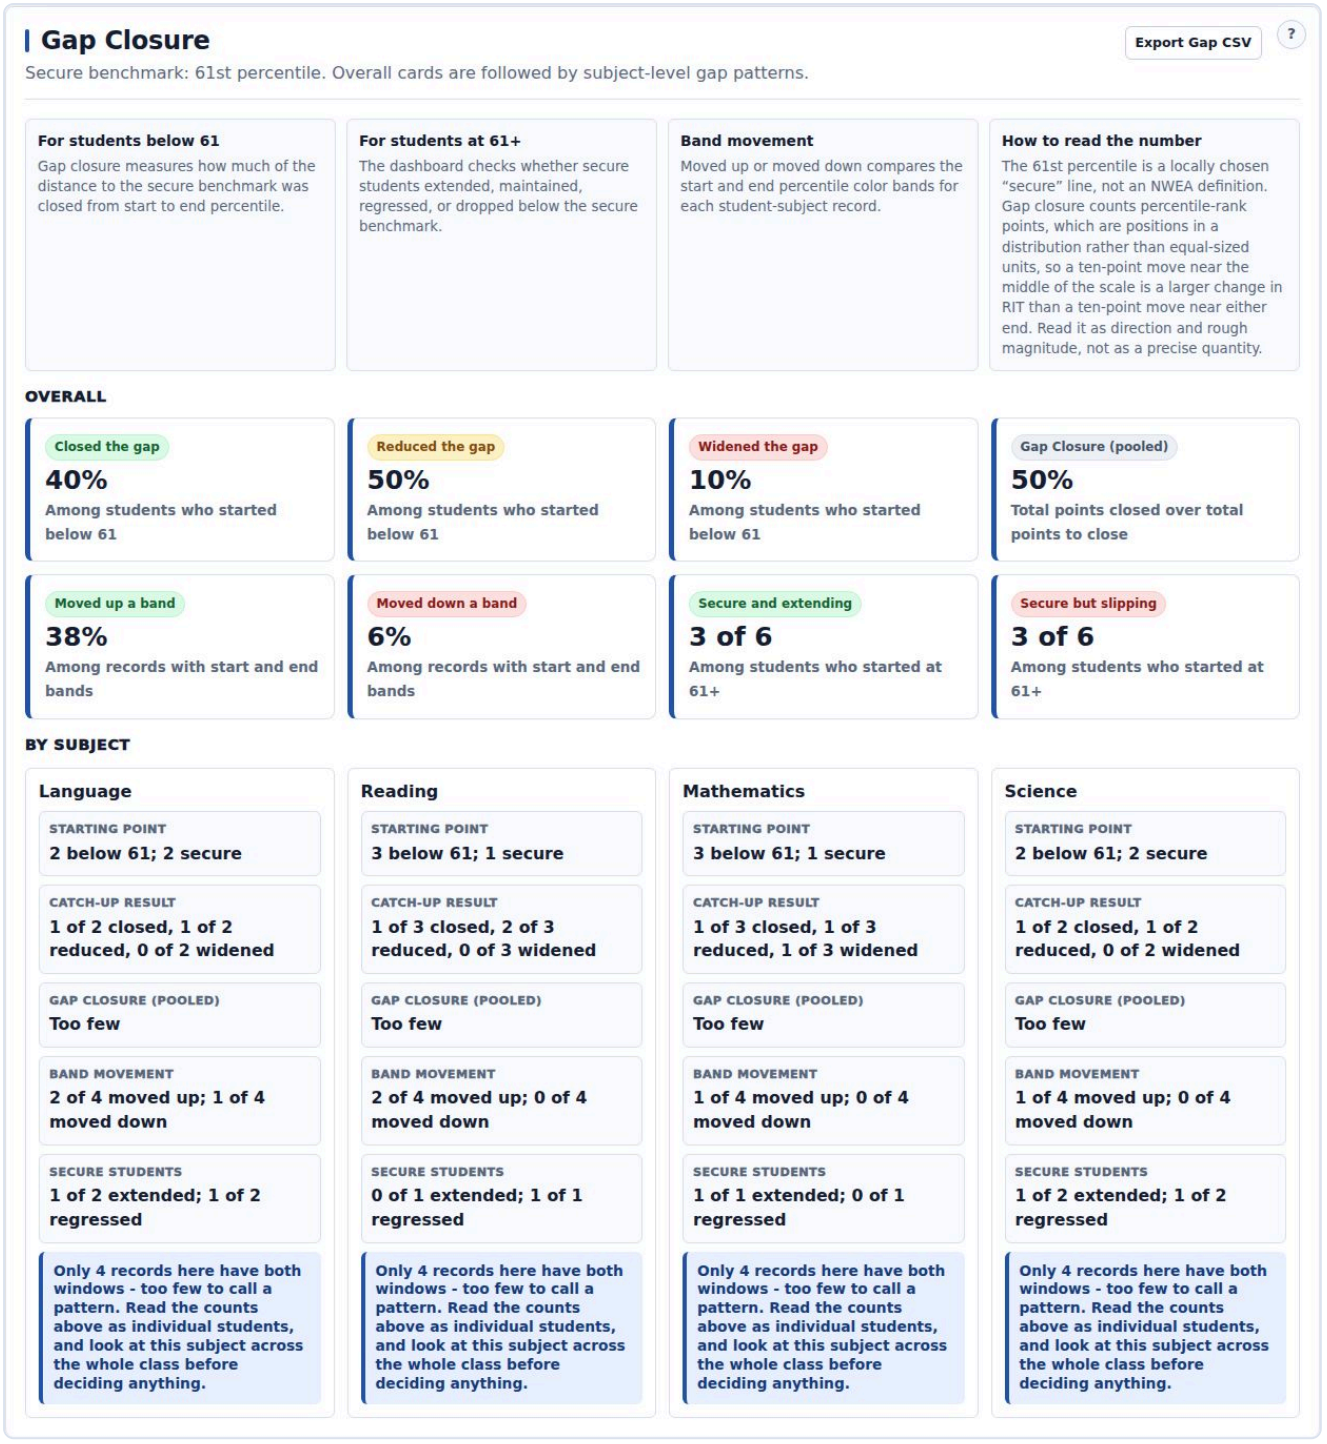

Achievement is where a score sits; growth is how far it moved compared with students who started in the same place, where 50 is typical. High achievement can hide low growth, and a low start can hide strong growth. Bands with fewer than 5 records are drawn but never read.

WHAT TO DO WITH IT

Look for the two patterns that matter most: secure students who are coasting, and low starters whose catch-up growth is working and needs protecting.

5.6 Gap Closure

Growth files only: this section is hidden when the export carries a single test window.

Gap Closure, shown with the sample data.

WHAT IT SHOWS

Among records that started below the 61st percentile: how many closed the gap, reduced it or widened it, and the pooled share of the total distance that was closed. Also band movement, and whether secure starters extended or slipped.

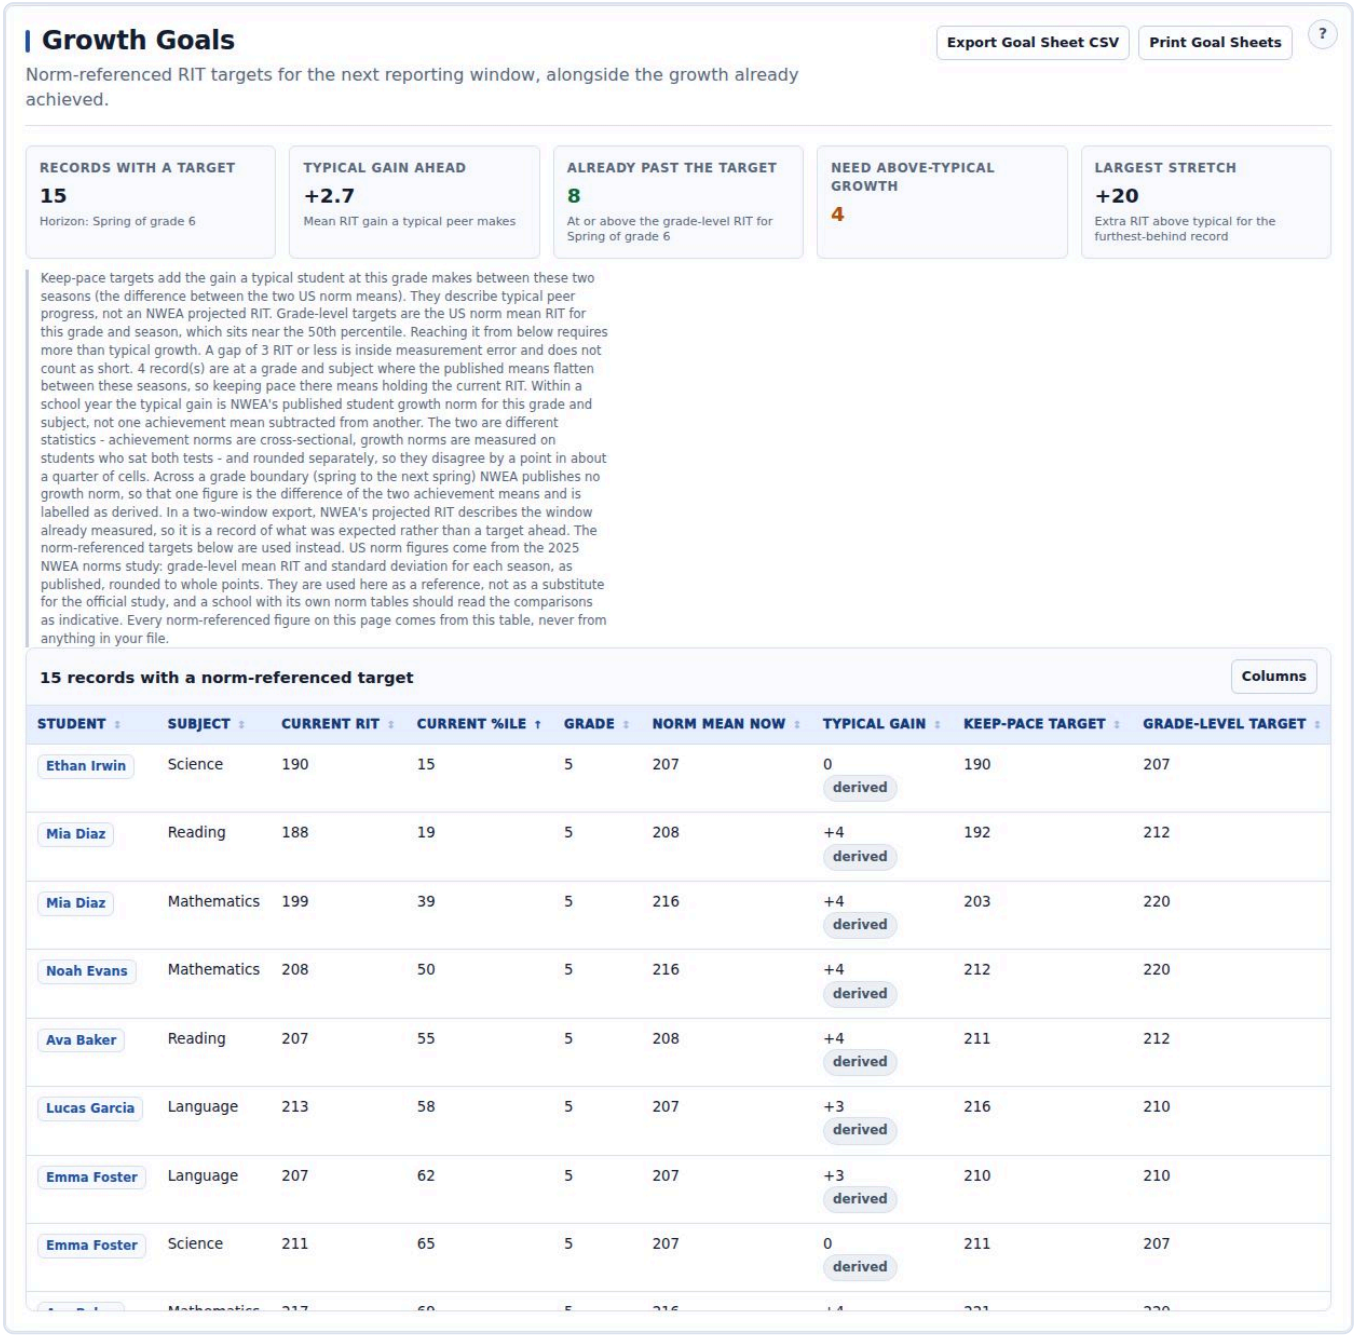

HOW TO READ IT

The 61st percentile is a locally chosen secure line, not an NWEA definition. Percentile points are positions in a distribution rather than equal units, so read gap closure as direction and rough size. Pooled closure is total points closed over total points to close, not an average of individual rates.

WHAT TO DO WITH IT

Celebrate the closers by name in class, and look first at the secure students who slipped, because core teaching alone rarely catches them.

5.7 Growth Goals

Growth Goals, shown with the sample data.

WHAT IT SHOWS

Norm-referenced RIT targets for the next reporting point: the typical gain a peer makes, a keep-pace target, the grade-level target and the stretch above typical some students need. Where a fall export carries NWEA's own projection, that figure leads.

HOW TO READ IT

Keep pace means holding your relative position; grade level means reaching the norm mean. Typical gain comes from the difference between two norm means, not from NWEA's projection for an individual student. The norm table built in is a reference, not the official study.

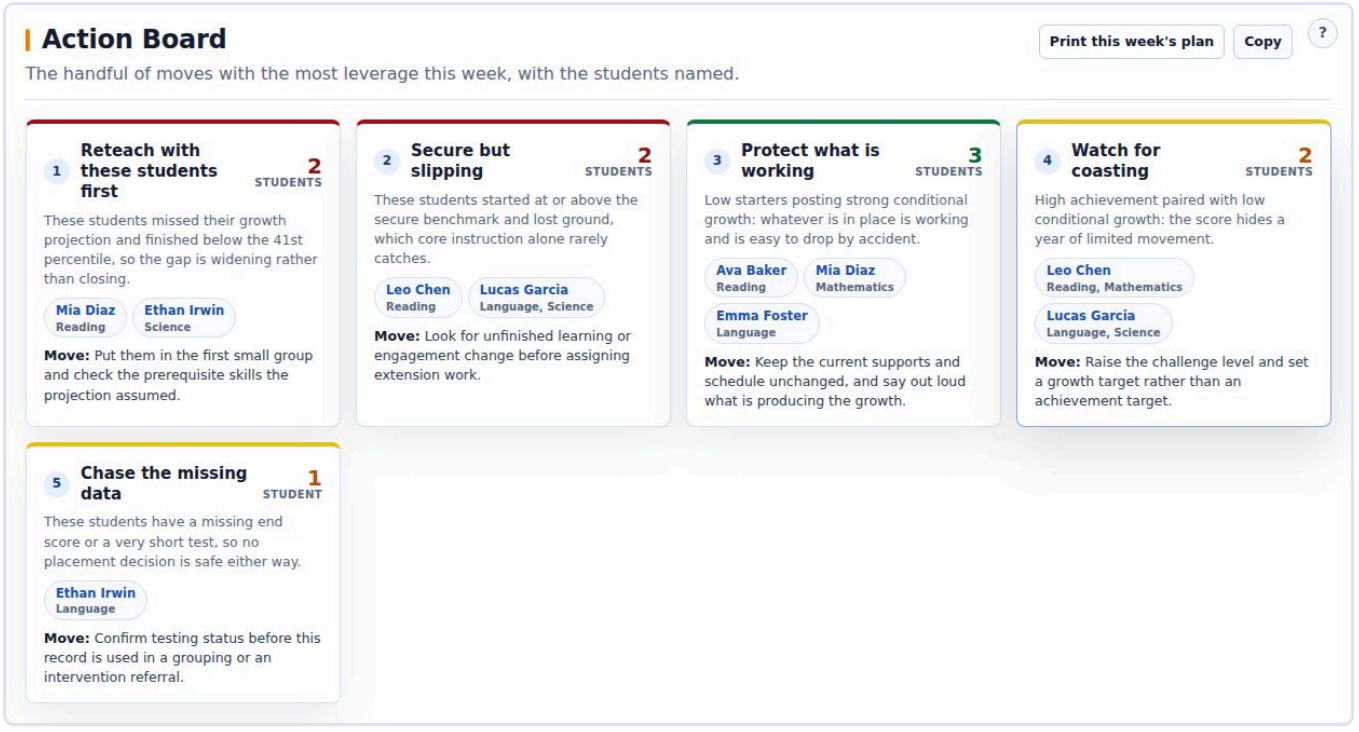

WHAT TO DO WITH IT

Print the goal sheets, set a written target for every student who needs above-typical growth, and re-upload after the next window so the target becomes a result. Use Columns to show only the columns you need; hiding a column does not change the CSV.

ON A SINGLE-WINDOW FILE

Norm-referenced RIT targets for the end of this school year, so the winter or spring upload has something to measure against: the typical gain, a keep-pace target, the grade-level target and the stretch above typical some students need. Where the export carries NWEA's own projection for the window ahead, that figure leads.

5.8 Action Board

Action Board, shown with the sample data.

WHAT IT SHOWS

The handful of moves with the most leverage this week, ranked, each with the students it applies to and the move to make.

HOW TO READ IT

Each card names students, deduplicated across subjects and capped at forty names; the reason on the card is the rule that put them there. A student can appear on more than one card.

WHAT TO DO WITH IT

Treat it as this week's plan. Print it or copy it into your planning notes, and come back after the next window to see which cards emptied.

5.9 What Would It Take?

What Would It Take?

Export Closest CSV

How far this group is from having 60% of records at or above the 61st percentile, and which students are closest to it.

THRESHOLD: 61st percentile - secure benchmark
The line you want students above.

TARGET SHARE (%): 60
Leave as set, or type the percentage your plan aims for.

AT OR ABOVE NOW	TARGET	RECORDS STILL NEEDED	FURTHEST OF THOSE	BELOW THE LINE
56%	60%	1	3 pts	7
9 of 16 scored records	61st percentile - secure benchmark	To reach the target share	Percentile points Lucas Garcia needs	All records under the threshold

Moving the students already closest to a line is the fastest way to change a percentage and the wrong way to decide who gets taught. Use this to size a goal and to see how far off it is; the Support List answers who needs the teaching. Percentile points are also not equal-sized units, so two records the same distance from the line are not the same amount of work.

7 records below the 61st percentile, 1 of them needed for the target

STUDENT	SUBJECT	PERCENTILE	POINTS TO LINE	BAND	CHANGE THIS WINDOW	MET GROWTH	PLANNING GROUP
Lucas Garcia NEEDED	Language	58	3	Yellow	-15	No	Secure but Regressing
Ava Baker	Reading	55	6	Yellow	+20	Yes*	Catch-Up Growth
Noah Evans	Mathematics	50	11	Yellow	-10	No	Targeted Support
Ethan Irwin	Language	43	18	Yellow	+31	Missing	Incomplete Data
Mia Diaz	Mathematics	39	22	Orange	+17	Yes	Catch-Up Growth
Mia Diaz	Reading	19	42	Red	+1	No*	Intensive Support
Ethan Irwin	Science	15	46	Red	+14.5	No	Intensive Support

What Would It Take?, shown with the sample data.

WHAT IT SHOWS

How far the group is from having a chosen share of records at or above a chosen percentile line, and which records are closest to that line.

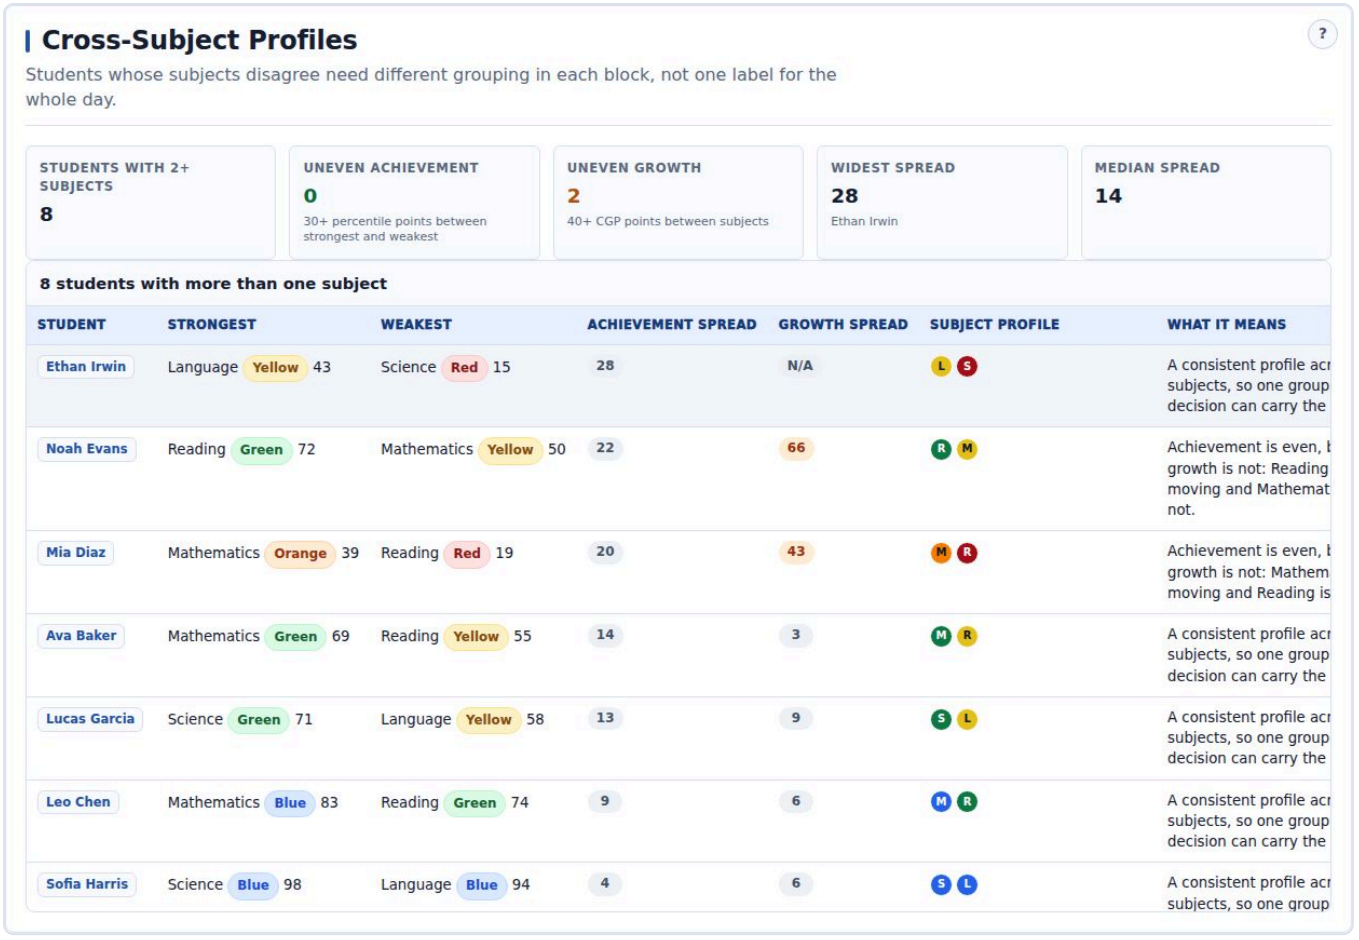

HOW TO READ IT

This sizes a goal; it does not decide who gets taught. Moving the students nearest the line is the fastest way to change a percentage and the wrong way to choose who needs help. The support list answers that question.

WHAT TO DO WITH IT

Pick the line and the share you would be judged against, see how many records it would take, and set a target the class can own.

5.10 Cross-Subject Profiles

Cross-Subject Profiles

Students whose subjects disagree need different grouping in each block, not one label for the whole day.

STUDENTS WITH 2+ SUBJECTS	UNEVEN ACHIEVEMENT	UNEVEN GROWTH	WIDEST SPREAD	MEDIAN SPREAD
8	0 30+ percentile points between strongest and weakest	2 40+ CGP points between subjects	28 Ethan Irwin	14

8 students with more than one subject

STUDENT	STRONGEST	WEAKEST	ACHIEVEMENT SPREAD	GROWTH SPREAD	SUBJECT PROFILE	WHAT IT MEANS
Ethan Irwin	Language Yellow 43	Science Red 15	28	N/A	L S	A consistent profile acr subjects, so one group decision can carry the
Noah Evans	Reading Green 72	Mathematics Yellow 50	22	66	R M	Achievement is even, b growth is not: Reading moving and Mathemat not.
Mia Diaz	Mathematics Orange 39	Reading Red 19	20	43	M R	Achievement is even, b growth is not: Mathem moving and Reading is
Ava Baker	Mathematics Green 69	Reading Yellow 55	14	3	M R	A consistent profile acr subjects, so one group decision can carry the
Lucas Garcia	Science Green 71	Language Yellow 58	13	9	S L	A consistent profile acr subjects, so one group decision can carry the
Leo Chen	Mathematics Blue 83	Reading Green 74	9	6	M R	A consistent profile acr subjects, so one group decision can carry the
Sofia Harris	Science Blue 98	Language Blue 94	4	6	S L	A consistent profile acr subjects, so one group

Cross-Subject Profiles, shown with the sample data.

WHAT IT SHOWS

For every student with two or more subjects: their strongest and weakest subject, the spread between them in percentile points, and in a growth file the same comparison for conditional growth.

HOW TO READ IT

A spread of 30 points or more is an uneven profile. It usually means a different group in one subject than another, not a different child.

WHAT TO DO WITH IT

Use it when grouping: a student who is secure in reading and intensive in maths belongs in two different groups, and one grouping decision will not carry the day.

5.11 Instructional Areas

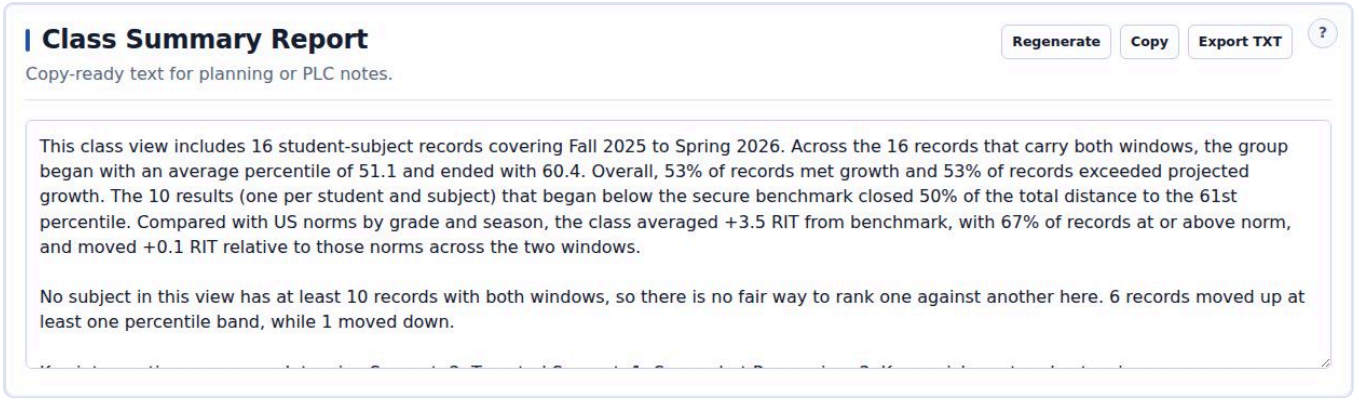

Class Profile exports only: an ASG export does not carry instructional areas, so this section appears only when a Class Profile file is loaded.

WHAT IT SHOWS
From a Class Profile export only: the instructional areas within each subject where the class stands out as a strength or a gap, and the students whose own area score sits well below their overall score.

HOW TO READ IT
Area scores are read against each student's own overall RIT, because NWEA publishes no norm for an area, so above means above their own level, not above grade level. Class patterns need a confidence interval that clears zero; individual flags need a difference larger than the noise floor.

WHAT TO DO WITH IT
Choose what to reteach to the whole class from the class patterns, and who needs the small group from the flagged students.

5.12 Class Summary Report

Class Summary Report, shown with the sample data.

WHAT IT SHOWS
A copy-ready narrative of the current view, written from the same figures as the cards above it.

HOW TO READ IT
It follows your filters until you edit it; after that it keeps your words until you press Regenerate. Where a figure would rest on too few records it says so rather than quoting a percentage.

WHAT TO DO WITH IT
Paste it into PLC notes, a report to a leader, or the start of a data conversation, and edit it into your own voice.

5.13 Table Groups and Seating Plan

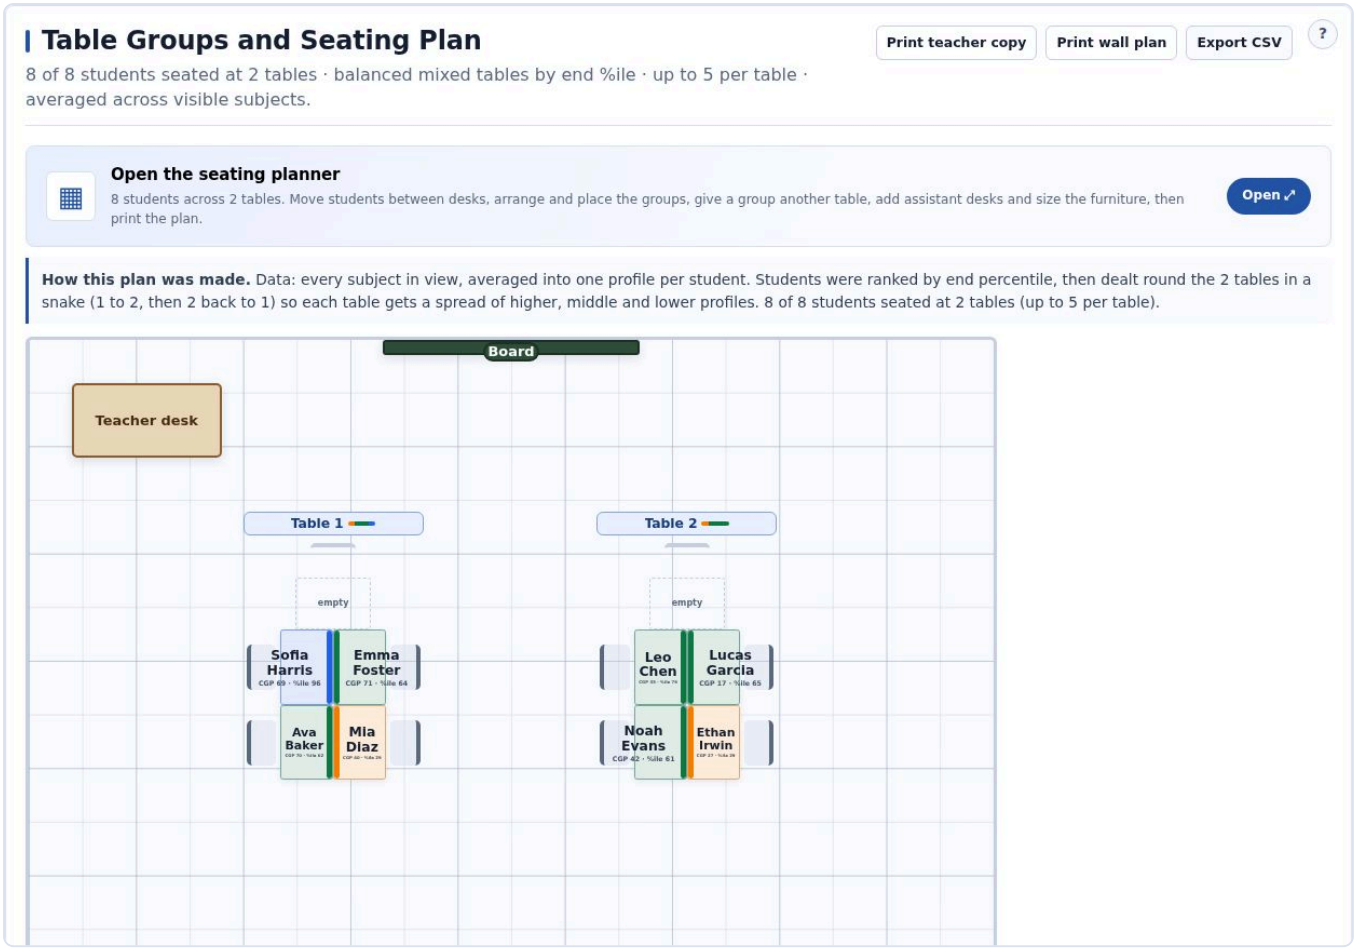

Table Groups and Seating Plan, shown with the sample data. (The top of the section; it continues below on screen.)

WHAT IT SHOWS

Table groups built from the data by a chosen strategy, and a full-screen planner drawn to scale: your room's size in metres, single desks (70 x 49 cm unless you set another size) pushed together into groups, a chair behind each, and your own furniture at its real size. A group of five is two facing pairs with one desk at the head; you can also choose a desk at each end, a row facing the front, a horseshoe or a round table. A group can sit at more than one table, and an assistant has a desk of their own. The room is remembered on this device; the students never are.

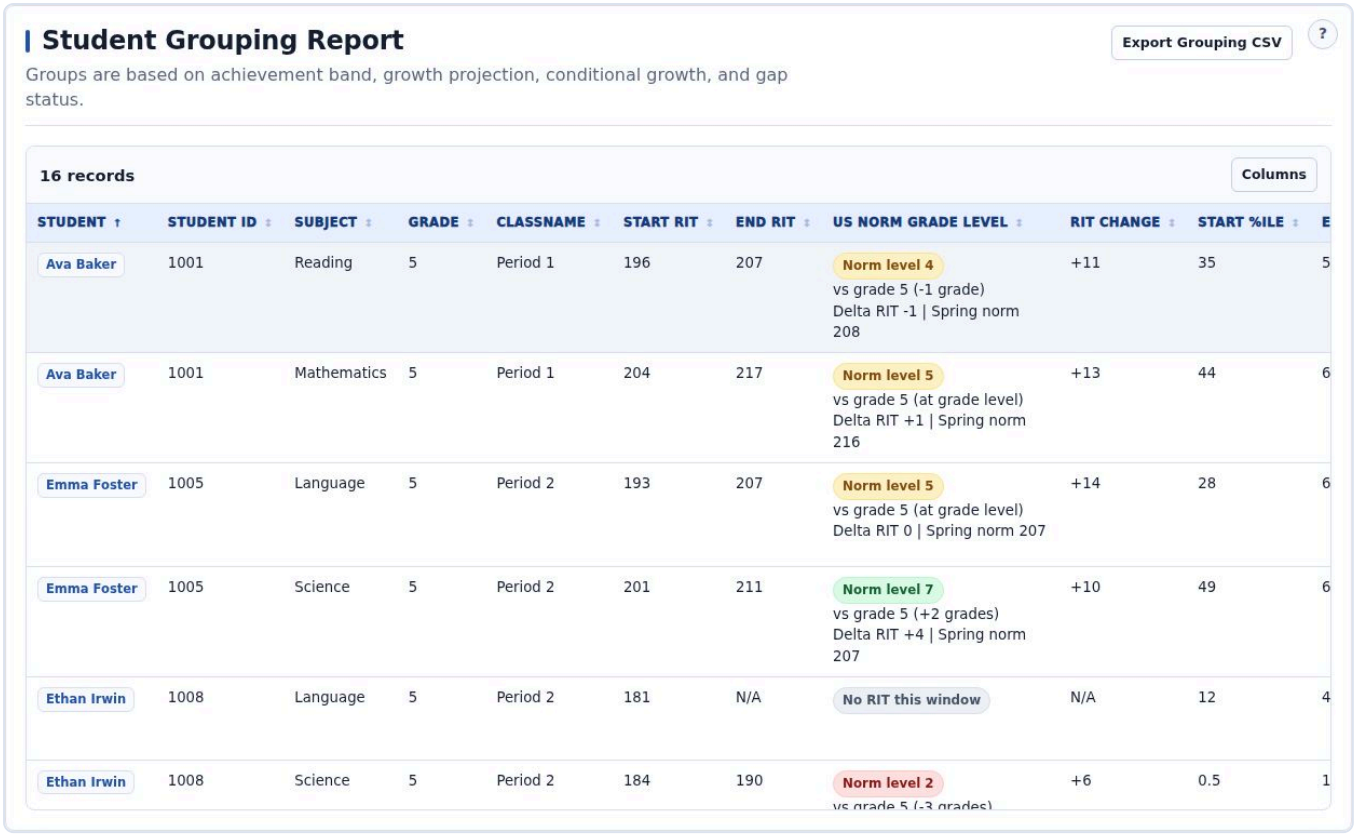

HOW TO READ IT

Each desk carries the student's band colour and the score that drove the grouping; the strip on each table's name plate shows its band mix, so a balanced table reads as a spread of colours and a skill group as one block. Names are always shown in full, sized to fit the desk. When a group sits at more than one table, the extra tables carry its name and a letter (Table 1 · B) and show how many of their desks are filled. A warning above the room names any tables that overlap or stand on furniture. The paragraph under the room says exactly how the plan was made, and the placement-order toggle numbers the desks in the order the strategy dealt them. Students without a usable score wait in Unplaced rather than being seated by a number they do not have.

WHAT TO DO WITH IT

Set your room size and desk size under Room, add and size the board, door, windows and teacher desk, then build the groups for the week. Select a table and choose Add a table to this group when a group needs more room: the group keeps its students and its seats carry on across the tables, and each table can be moved, turned and given its own number of desks. Add an assistant desk from Add to room: one desk and a chair with no student seat. Drag anyone the data placed badly to any desk (dropping on a taken desk swaps), save a plan file under Room to keep who sits where for next time, and print the teacher copy for your planner and the wall plan, with names only, for the room.

5.14 Student Grouping Report

Student Grouping Report

Groups are based on achievement band, growth projection, conditional growth, and gap status.

Export Grouping CSV

16 records

Columns

STUDENT	STUDENT ID	SUBJECT	GRADE	CLASSNAME	START RIT	END RIT	US NORM GRADE LEVEL	RIT CHANGE	START %ILE	E
Ava Baker	1001	Reading	5	Period 1	196	207	Norm level 4 vs grade 5 (-1 grade) Delta RIT -1 | Spring norm 208	+11	35	5

Student Grouping Report, shown with the sample data.

WHAT IT SHOWS

Every record in view in one sortable table: scores, bands, growth, gap status, the planning group the dashboard suggests and the teacher action that goes with it.

HOW TO READ IT

This is the full evidence behind every card above. Sort a column by clicking its heading; the group and gap filters at the top narrow it.

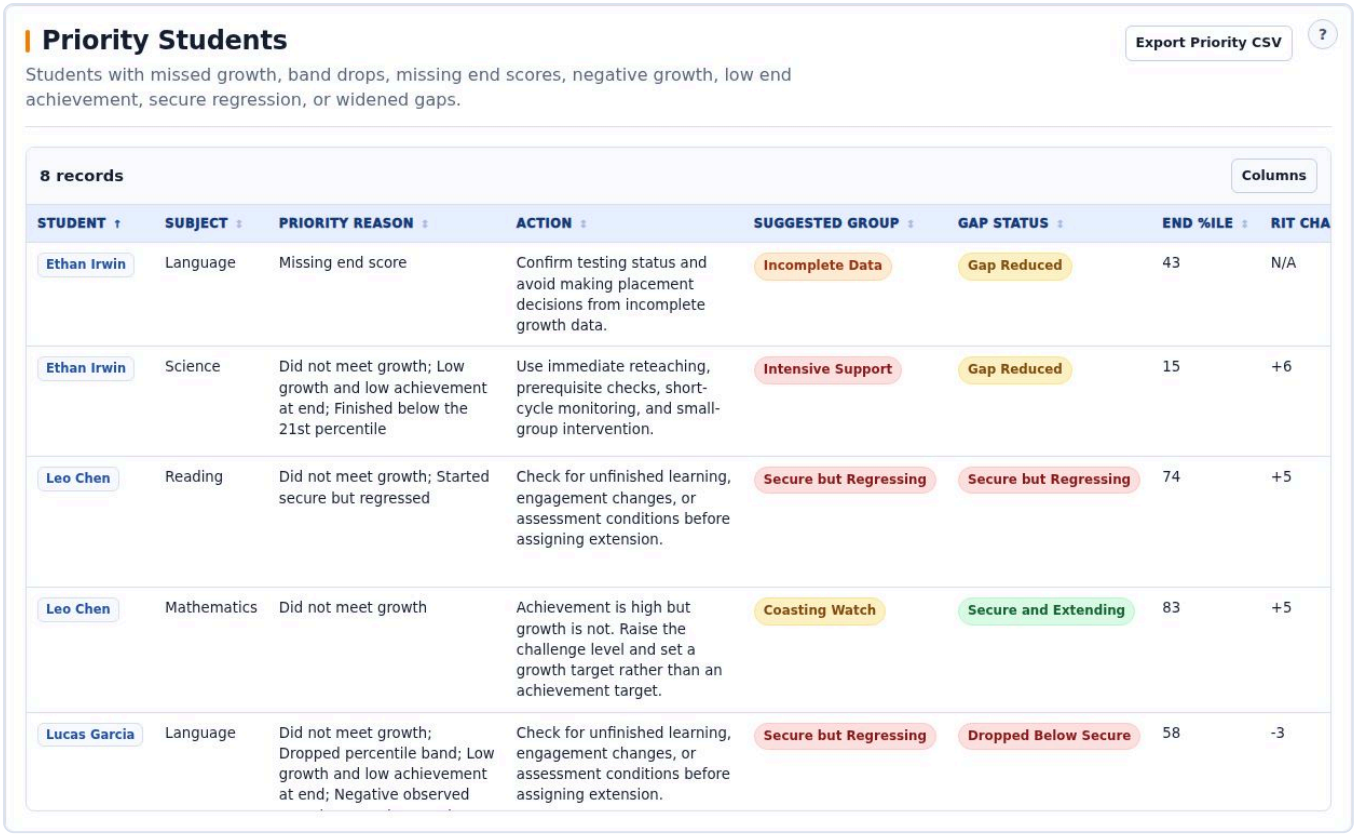

WHAT TO DO WITH IT

Export it as a CSV for your own planning documents, or open a student's name for their one-page spotlight. The table has a column for everything, so use Columns to show only the ones you need; hiding a column does not change a CSV export.

ON A SINGLE-WINDOW FILE

Every record in view in one sortable table: RIT, percentile, band, tier, distance from the norm, the planning group the dashboard suggests and the teacher action that goes with it. Growth columns appear once a second window exists.

5.15 Priority Students (called Start-of-Year Support List on a single-window file)

Priority Students

Students with missed growth, band drops, missing end scores, negative growth, low end achievement, secure regression, or widened gaps.

Export Priority CSV

8 records

Columns

STUDENT	SUBJECT	PRIORITY REASON	ACTION	SUGGESTED GROUP	GAP STATUS	END %ILE	RIT CHA
Ethan Irwin	Language	Missing end score	Confirm testing status and avoid making placement decisions from incomplete growth data.	Incomplete Data	Gap Reduced	43	N/A
Ethan Irwin	Science	Did not meet growth; Low growth and low achievement at end; Finished below the 21st percentile	Use immediate reteaching, prerequisite checks, short-cycle monitoring, and small-group intervention.	Intensive Support	Gap Reduced	15	+6
Leo Chen	Reading	Did not meet growth; Started secure but regressed	Check for unfinished learning, engagement changes, or assessment conditions before assigning extension.	Secure but Regressing	Secure but Regressing	74	+5
Leo Chen	Mathematics	Did not meet growth	Achievement is high but growth is not. Raise the challenge level and set a growth target rather than an achievement target.	Coasting Watch	Secure and Extending	83	+5
Lucas Garcia	Language	Did not meet growth; Dropped percentile band; Low growth and low achievement at end; Negative observed	Check for unfinished learning, engagement changes, or assessment conditions before assigning extension.	Secure but Regressing	Dropped Below Secure	58	-3

Priority Students, shown with the sample data.

WHAT IT SHOWS

Records that need attention first, each with the reasons: missed growth, a dropped band, a missing end score, negative growth, finishing below the 21st percentile, secure regression or a widened gap.

HOW TO READ IT

A record can be listed for a reason other than low achievement, so the reason column matters more than the tier. A met-growth call within measurement error is marked too close to call.

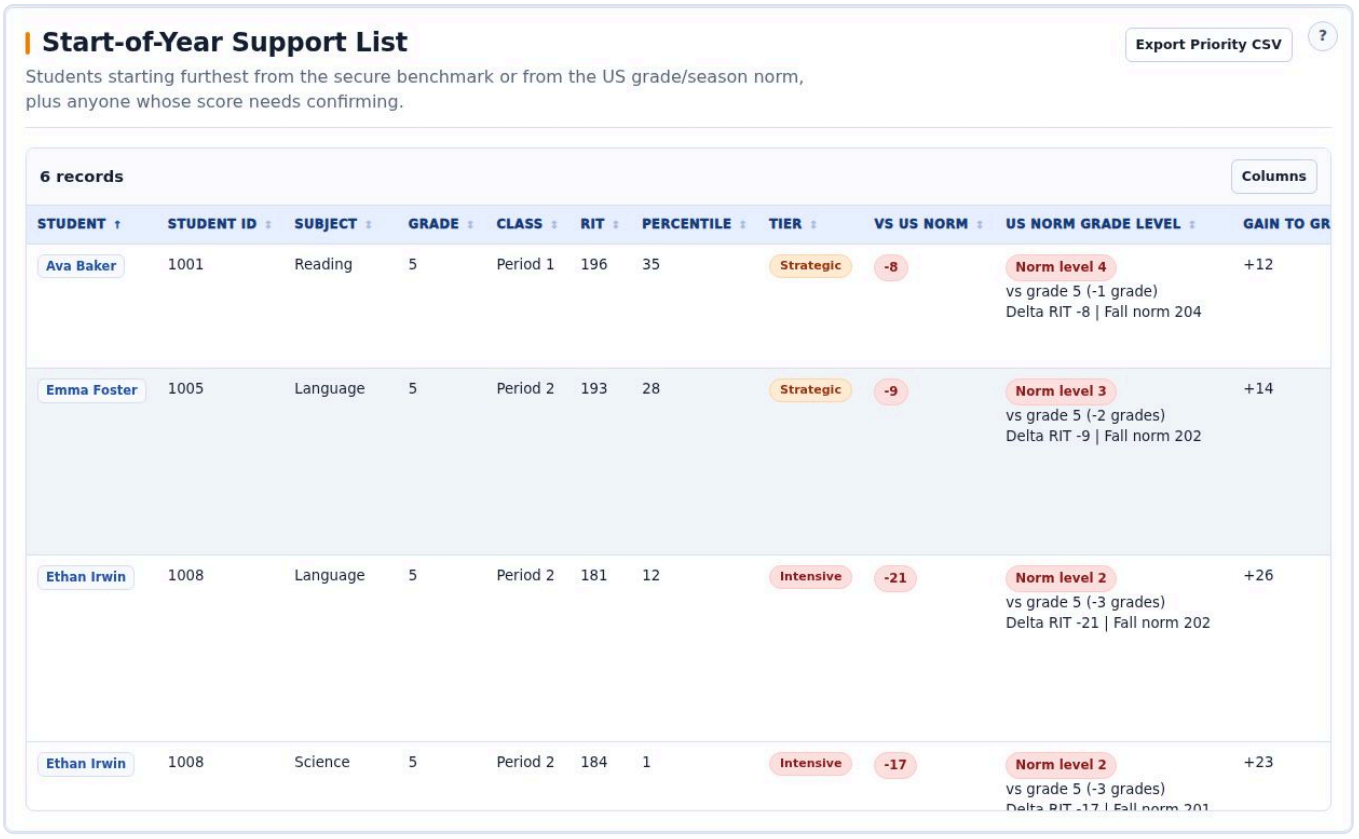

WHAT TO DO WITH IT

This is where the first small groups come from. Name three students and what changes for them this week, before anyone asks. The table has a column for everything, so use Columns to show only the ones you need; hiding a column does not change a CSV export.

ON A SINGLE-WINDOW FILE

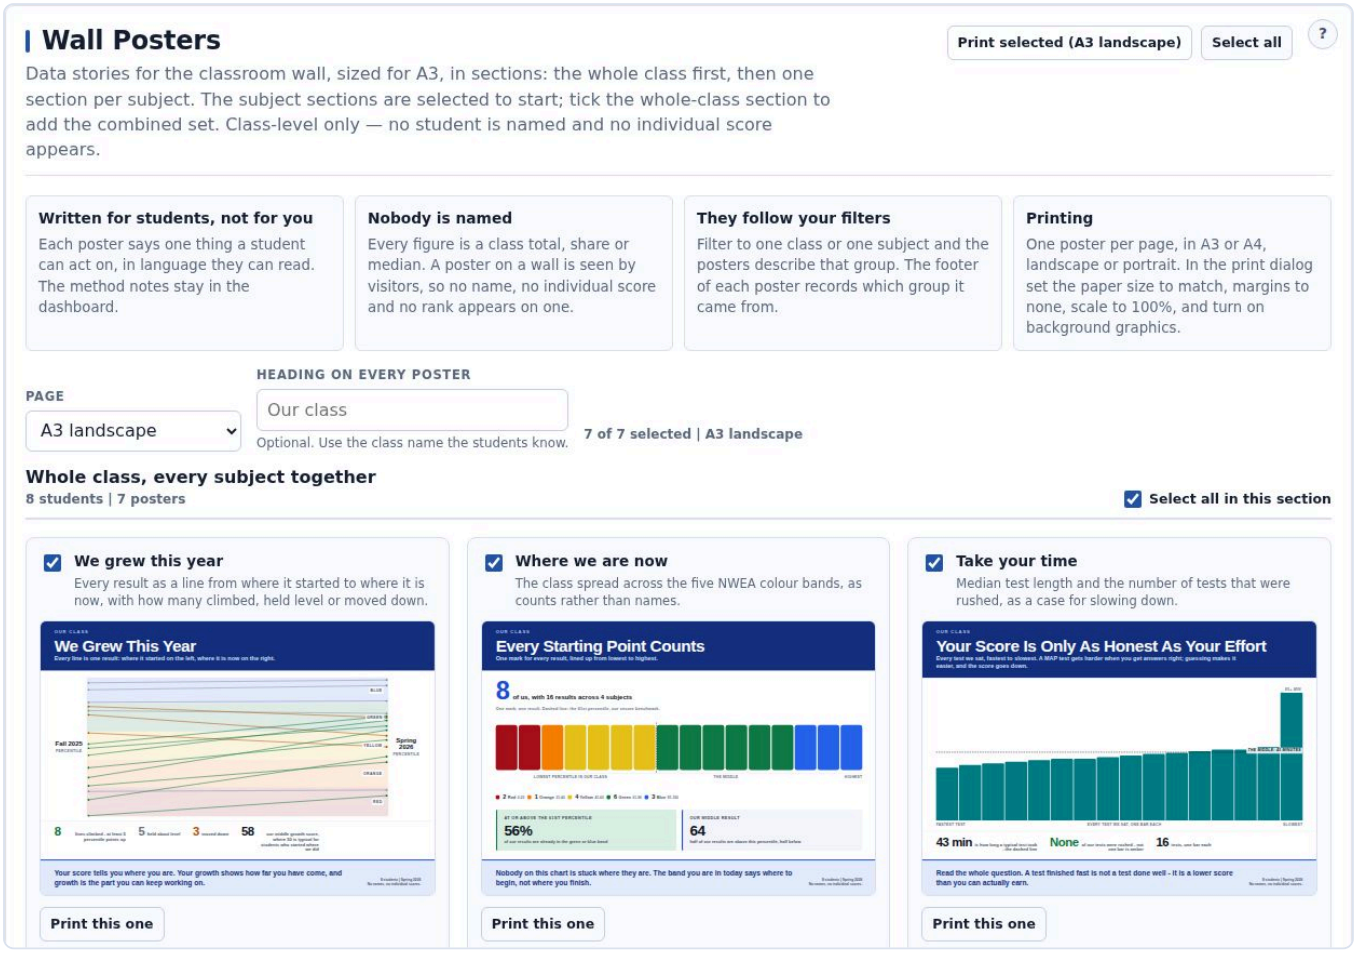

Records that need attention from the start of the year, each with the reasons: starting below the 41st percentile, testing a grade or more below placement, sitting well below the norm, needing above-typical growth to reach grade level, or a score that needs confirming.

A record can be listed for a reason other than low achievement, so the reason column matters more than the tier.

On a fall file the list becomes the Start-of-Year Support List, with start-of-year reasons.

5.16 Wall Posters

Wall Posters, shown with the sample data. (The top of the section; it continues below on screen.)

WHAT IT SHOWS

Posters for the classroom wall, written for students in student language: class shares, medians and counts only, with no name, no individual score and no rank on any of them.

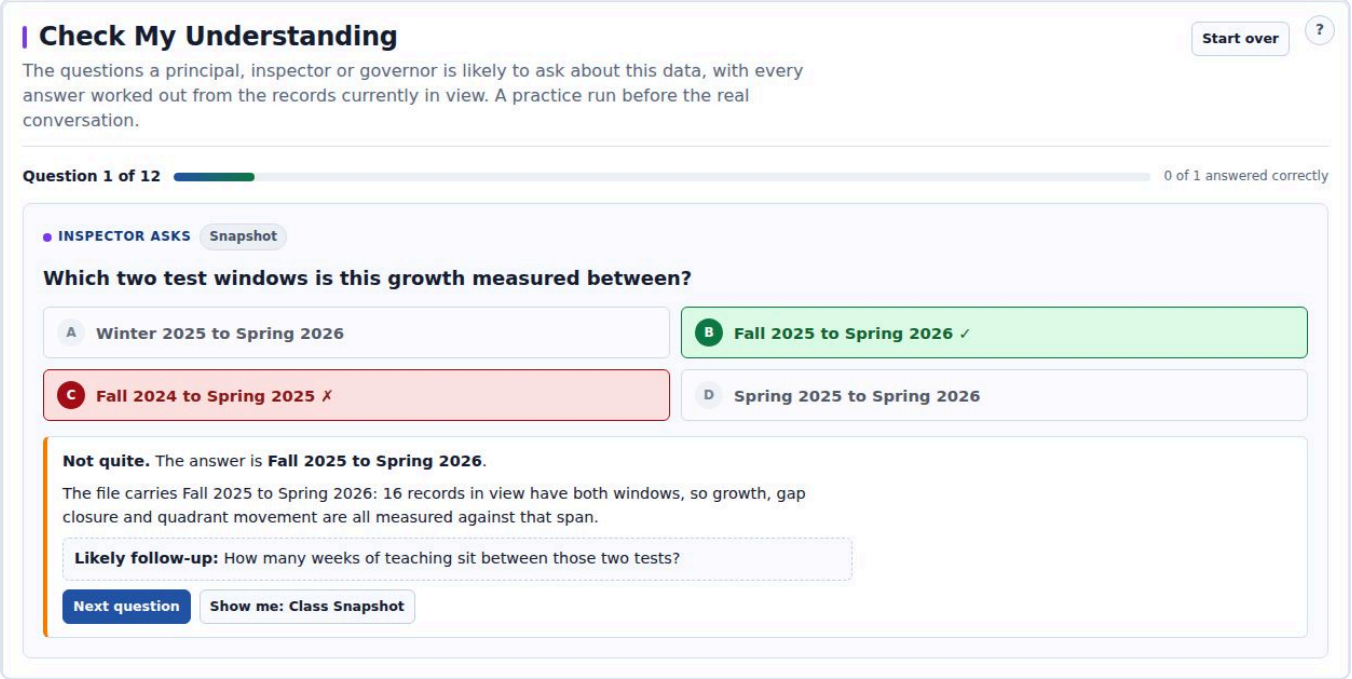

HOW TO READ IT

Which posters are available depends on the file: growth posters need two windows and at least 10 growth results, the learning-areas poster needs a Class Profile export, and every poster needs at least 5 students in view. The footer of each records which group it describes.

WHAT TO DO WITH IT

Tick the posters you want, choose A3 or A4, add the class name the students know, and print with background graphics on and fit-to-page.

5.17 Check My Understanding

Check My Understanding, shown with the sample data.

WHAT IT SHOWS

A practice run for the data conversation: multiple-choice and true-or-false questions a principal, inspector, governor, data lead or head of department would ask about the records in view, marked against the figures on this page.

HOW TO READ IT

Every question is built from the current view, so filter to one class or subject to rehearse for that meeting. Each answer is coached with the figure, a jump to the section that shows it, and the follow-up a leader would ask next.

WHAT TO DO WITH IT

Run a set before a data meeting, read back the ones you missed, and copy the prep notes.

5.18 Celebration Students (called Strengths to Build On on a single-window file)

Celebration Students

Export Celebration CSV

Students showing exceeded growth, band movement, gap closure, strong RIT improvement, or quadrant improvement.

9 records

Columns

STUDENT	SUBJECT	CELEBRATION REASON	NEXT EXTENSION	GROWTH EFFICIENCY	%ILE CHANGE	BAND MOVEMENT	GAP STAT
Ava Baker	Reading	Exceeded projected growth; Moved up a band; Reduced gap significantly; Improved RIT strongly	Celebrate the growth and keep the intervention plan consistent.	122% Exceeded strongly	+20	Moved Up	Gap Redu
Ava Baker	Mathematics	Exceeded projected growth; Moved up a band; Closed the gap; Improved RIT strongly; Moved from Low-A to High-A	Assign extension work and track whether high achievement is still paired with high growth.	130% Exceeded strongly	+25	Moved Up	Gap Clos
Emma Foster	Language	Exceeded projected growth; Moved up a band; Closed the gap; Improved RIT strongly; Moved from Low-A to High-A	Assign extension work and track whether high achievement is still paired with high growth.	156% Exceeded strongly	+34	Moved Up	Gap Clos
Emma Foster	Science	Exceeded projected growth; Moved up a band; Closed the gap	Assign extension work and track whether high achievement is still paired with high growth.	111% Exceeded	+16	Moved Up	Gap Clos
Ethan Irwin	Language	Moved up a band; Reduced gap significantly	Name the success, then set the next measurable goal.	N/A Missing	+31	Moved Up	Gap Redu
Mia Diaz	Mathematics	Exceeded projected growth	Celebrate the growth and keep the intervention plan consistent	111% Exceeded	+17	Stayed Same	Gap Redu

Celebration Students, shown with the sample data.

WHAT IT SHOWS

Records with something to celebrate: growth beyond the projection, a band moved up, a gap closed or sharply reduced, a strong RIT gain, or a rise from low to high on a quadrant axis, each with a next extension.

HOW TO READ IT

Celebration is about growth, not just high scores. A secure student who grew slowly is not here; a low starter who beat their projection is.

WHAT TO DO WITH IT

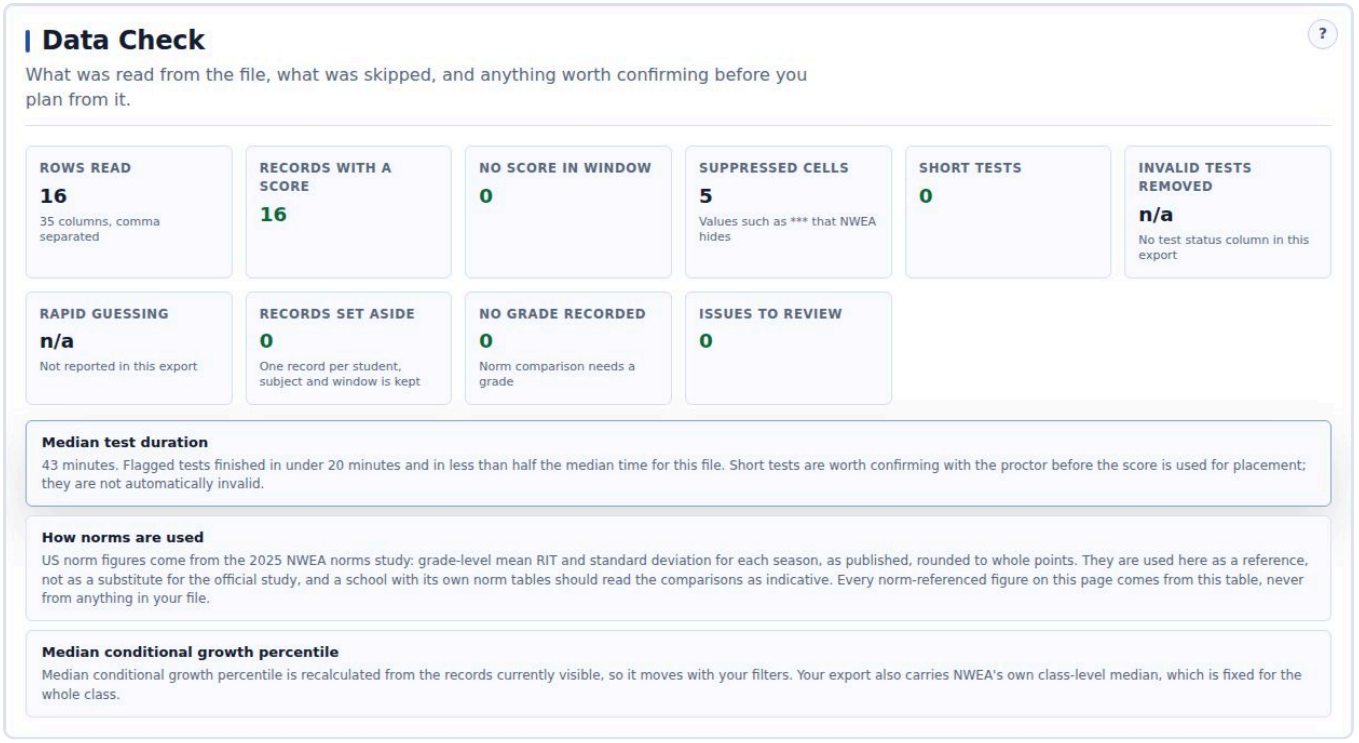

Name the success to the student, then set the next measurable target so celebration does not turn into coasting. Use Columns to show only the columns you need; hiding a column does not change a CSV export.

ON A SINGLE-WINDOW FILE

Records already showing a strength at the start of the year: at or above the secure line, well above the norm mean, testing a grade or more above placement, or already above the grade-level target, each with an extension action.

These are strengths to build on from day one, not growth: with one window nothing here measures movement.

5.19 Data Check

Data Check, shown with the sample data.

WHAT IT SHOWS

What was read from the file and what was not: rows, columns, suppressed cells, tests with no score, duplicate rows, tests marked not valid, short or rapidly guessed tests, the norms study the file was scored against, and the rule that turns thin percentages into counts.

HOW TO READ IT

Check it before you plan from anything else. A missing column hides a feature rather than showing a zero; a norms mismatch means the RIT-versus-norm figures will not match your MAP reports; a short test is a signal to confirm, not an invalid score.

WHAT TO DO WITH IT

Chase the students with no score, confirm the short tests, and read the counts-instead-of-percentages note if a figure surprised you.

6. Printing, exporting and the classroom wall

Exports

- **Summary TXT** from Class Snapshot or the Class Summary Report - the narrative as plain text for notes or an email.
- **CSV exports** from Grouping, Priority, Celebration, Gap Closure, Growth Goals, Instructional Areas, What Would It Take and Table Groups. Exports always include every row, even when the table on screen shows a page of them, and are the same whatever columns you have hidden: the Grouping, Priority, Celebration and Growth Goals tables (the support list and the strengths list, on a start-of-year file) each have a *Columns* button that lists their columns as tick-boxes, with *Key columns* and *All columns* to switch between a short table and the full one. Your choice for each table is remembered on this device. The table groups export has one row per seat: table, seat, how the table's desks are arranged, the order the strategy placed each student and whether you moved them by hand, then the student's scores and where the table stands, in centimetres from the left and front walls.
- **Copy** buttons on the Summary, the Action Board, a student's spotlight and the quiz results put the text on your clipboard.

Printing

- **Goal sheets** - two pages per student from Growth Goals. Page one is the data: where they are now in each subject, the grade level that score has reached on the US norms (the highest grade whose typical score, in that season, the score has reached, so a Grade 5 student one point under the typical Grade 5 fall score is placed in Grade 4, with the typical scores it rests on printed beside it; a student who has reached the typical score for their own grade or higher simply reads “At my grade level”), their next step, and the instructional areas inside each subject. Page two is theirs to fill in: the same targets in one line each, the part of each subject to work on first, and ruled space for the goal they set, what they will do about it and how you will help, with a line for both signatures and the date. The sheets keep their explanations short: a one-line note says what US norms are, and that every student has a next target whatever their level. The two pages are a firm limit, so they print back to back on one sheet: a student with many subjects or areas gets a slightly smaller print rather than a third page, and a student with more than eight subjects has the first eight printed (the page tells you when that happens).
- **The action plan** - the Action Board as a printable list of moves with the students named.
- **The seating plan** - two prints from the planner, both drawn to scale: the room at the size you set, single desks pushed into groups with a chair behind each, and your furniture at its real size. A group that needs more room can sit at more than one table: select its table and choose *Add a table to this group*, and the group keeps its students while its seats carry on across the tables (the extra tables are named Table 1 · B, Table 1 · C, and so on, and each can be moved, turned and given its own number of desks). An assistant gets a desk of their own from *Add to room*: one desk and a chair, with no student seat. Both appear on both prints. The *teacher copy* shows every desk with the student's band colour and score, then adds roster pages with each table's students, band, percentile, growth (or NWEA's projected gain for a projection file) and planning group; a table is never split across two pages, and the pages say only that students are grouped according to data and behaviour patterns. The *wall plan* draws the same room with names only: no score, no colour, nothing a visitor can read as data. Every name is printed in full, in proper case, sized to fit its desk, never cut short. *Save plan file* in the planner's Room menu keeps the whole plan - the room, the table names and who sits where, by student ID - in a file on your computer;

Load plan file brings it back. Both fit A4 or A3, landscape or portrait to match the room's shape; choose A3 for a wall plan so the names print larger. On a laptop screen the planner draws the whole room at once with the settings of the selected table beside it; the grouping controls are one click away under *Show grouping controls*, and + zooms in to read a small desk.

- **A student one-pager** - open any student's name for their spotlight, then print it for a conference.
- **The page itself** - the browser's print command prints the dashboard; the quiz and the seating tools are left out.

Wall posters

Posters are written for students, in student language, and carry class shares, medians and counts only: no name, no individual score, no rank. They follow your filters, so filter to one class before you print, and the footer of each records which group it describes. Which posters are available depends on the file: growth posters need two windows and at least 10 growth results, the learning-areas poster needs a Class Profile export, and every poster needs at least 5 students in view. A subject that fewer than 5 students sat is not given a row, a ladder or a median of its own, because a figure for three children is three children.

POSTER	WHAT IT SAYS
We grew this year	Every result as a line from where it started to where it is now, with how many climbed, held level or moved down.
Where we are now	The class spread across the five NWEA colour bands, as counts rather than names.
Our learning areas	The strand the class is strongest in and the one to work on next, from the Class Profile export.
The RIT ladder	What a year of growth looks like on the RIT scale, from where the class is now.
Growth is measured fairly	Median conditional growth by starting band, showing that growth is judged against a fair comparison.
Take your time	Median test length and the number of tests that were rushed, as a case for slowing down.
Our next milestone	How many more results the class needs above the chosen line to reach its target.
Catching up	Of the results that started below the class benchmark, how many moved towards it or crossed it.
Moving up	How many results moved up a whole colour band, stayed, or moved down, as counts rather than names.
Our subjects side by side	The class's middle percentile in each subject, so the strongest subject and the next focus are both on the wall.
How to read a MAP score	RIT, percentile and growth score explained in student language, with the five colour bands.

Choose A3 or A4, landscape or portrait; add the class name the students know; tick the posters you want and print. In the print dialog turn on background graphics and choose fit to page.

7. Before a data meeting

Three sections are built for the conversation with a leader rather than for planning.

- **Class Summary Report** writes the narrative for you, from the same figures as the cards. Edit it into your own voice and paste it into your notes.
- **Check My Understanding** asks you the questions a principal, inspector, governor, data lead or head of department would ask about the records in view, marks your answers against the page, and shows where each figure lives. Filter to the class the meeting is about, run a set, read back what you missed, and copy the prep notes.
- **Data Check** is the section to read first, so that nothing in the meeting surprises you: which students have no score, which tests were short, whether the file was scored against the norms study the page expects.

> **A USEFUL ORDER**
> Data Check, then Class Snapshot, then the Priority list and the Action Board, then the Summary. That is the order a leader will ask about them.

8. When something looks wrong

The file was skipped or nothing loaded

The file needs a RIT or percentile column. Check that it is a MAP export rather than a roster or a summary sheet, and that it is the CSV rather than the PDF or Excel version. Data Check lists any file that was skipped and why.

A section is missing

Sections that a file cannot support are hidden rather than shown empty: growth sections need two windows, the Instructional Areas section needs a Class Profile export, and any column the export lacks hides the feature that depends on it.

A figure shows "3 of 4" instead of a percentage, or "Too few"

Fewer than 10 records sit behind it. Widen the filters or read the count as a count.

"No US norm available"

NWEA publishes norms for Reading and Mathematics from kindergarten and for Language and Science from grade 2, and a record needs a grade to match. The Data Check counts the records that could not be matched and recovers grades suppressed on one row from the same student's other rows.

The RIT-versus-norm figures do not match my MAP report

The file was scored against a different norms study from the table built into the page; Data Check names both. Everything driven by the percentiles in your file is unaffected.

Printing opened nothing

A popup blocker stopped the print window. The dashboard downloads the same document as an HTML file instead; open it and print from there.

The posters are not available

Posters need at least 5 students in view, and any poster built on a percentage needs at least 10 records behind it. Clear the search and filters.

A. Glossary and reference tables

Planning groups and the teacher action that goes with them

GROUP	SUGGESTED ACTION
Intensive Support	Use immediate reteaching, prerequisite checks, short-cycle monitoring, and small-group intervention.
Targeted Support	Plan focused small-group lessons around the highest-impact skills and check progress frequently.
Watch Group	Keep core instruction tight, add quick checks, and respond before flat growth becomes a larger gap.
Secure / Maintain	Maintain grade-level access, spiral key skills, and monitor for steady progress.
Enrichment	Provide extension tasks, advanced problem solving, independent reading or inquiry, and leadership opportunities.
Catch-Up Growth	Protect the successful supports already working and keep pushing toward the secure benchmark.
Secure but Regressing	Check for unfinished learning, engagement changes, or assessment conditions before assigning extension.
Incomplete Data	Confirm testing status and avoid making placement decisions from incomplete growth data.
Core Instruction	Keep grade-level core instruction as the plan, with quick checks for understanding on the highest-leverage skills.
No Score Yet	Confirm whether this student tested. Do not place them from an absent or suppressed score.
Coasting Watch	Achievement is high but growth is not. Raise the challenge level and set a growth target rather than an achievement target.

Method notes, as they appear on the page

Norm Equivalent

Grade level is read strictly: the highest grade whose mean RIT, in the same season, the student's score has reached. A student under the mean for their own grade is placed in the grade below. Where grades share a mean the score fits them all, and the grade nearest the student's own is used. Flags, groups and counts ignore a shortfall of 3 RIT or less, which is inside measurement error. It is a placement signal from one test, not a reading or maths “grade level”.

Keep Pace

Keep-pace targets add the gain a typical student at this grade makes between these two seasons (the difference between the two US norm means). They describe typical peer progress, not an NWEA projected RIT.

Grade Level

Grade-level targets are the US norm mean RIT for this grade and season, which sits near the 50th percentile. Reaching it from below requires more than typical growth. A gap of 3 RIT or less is inside

measurement error and does not count as short.

Growth Error

A RIT score carries a standard error, so the difference between two of them carries a larger one. Where the export reports it, growth is shown with a 95% range and a result inside that range of its projection is marked too close to call. NWEA's own Yes or No is never changed - this sits beside it. The error is within-test only: it does not include illness, motivation or a bad morning, so the true uncertainty is wider than the range shown, not narrower.

Test Validity

NWEA marks a test it does not consider usable in the Status column. Those records are excluded from every aggregate, chart, poster and planning group on this page, and listed by name with their reason in Data Check. A status this page does not recognise is kept and counted, never silently dropped.

Rapid Guess

NWEA reports the share of items a student answered faster than they could have read them. This dashboard flags a test at 10% or more. Rapid guessing depresses the score, so a flagged test understates what the student can do - it is not a reason to lower expectations.

Instructional Area

An instructional area RIT rests on a fraction of the items behind the overall RIT, and NWEA publishes no percentile or norm for one. Every area figure here is the difference from the same student's own overall RIT on the same test.

Short Test

Flagged tests finished in under 20 minutes and in less than half the median time for this file. Short tests are worth confirming with the proctor before the score is used for placement; they are not automatically invalid.

Baseline

This file has one test window, so no growth can be measured. Everything below describes where students are starting, not how far they have moved.

Secure Benchmark

The 61st percentile is a locally chosen “secure” line, not an NWEA definition. Gap closure counts percentile-rank points, which are positions in a distribution rather than equal-sized units, so a ten-point move near the middle of the scale is a larger change in RIT than a ten-point move near either end. Read it as direction and rough magnitude, not as a precise quantity.

Norm Source

US norm figures come from the 2025 NWEA norms study: grade-level mean RIT and standard deviation for each season, as published, rounded to whole points. They are used here as a reference, not as a substitute for the official study, and a school with its own norm tables should read the comparisons as indicative. Every norm-referenced figure on this page comes from this table, never from anything in your file.

Typical Gain Source

Within a school year the typical gain is NWEA's published student growth norm for this grade and subject, not one achievement mean subtracted from another. The two are different statistics - achievement norms are cross-sectional, growth norms are measured on students who sat both tests - and rounded separately, so they disagree by a point in about a quarter of cells. Across a grade boundary (spring to the next spring) NWEA publishes no growth norm, so that one figure is the difference of the two achievement means and is labelled as derived.

Median C G P

Median conditional growth percentile is recalculated from the records currently visible, so it moves with your filters. Your export also carries NWEA's own class-level median, which is fixed for the whole class.

Nwea Projection

In a two-window export, NWEA's projected RIT describes the window already measured, so it is a record of what was expected rather than a target ahead. The norm-referenced targets below are used instead.

Forward Projection

This export carries NWEA's own projection for the window ahead: the growth it expects this student to make, and the RIT that follows from it. It is conditioned on the student's own starting score and grade rather than on a class-level norm mean, and it is the figure the next export will score “met growth” against - so it leads here. The norm-referenced targets stay beside it, because a projection describes typical progress from where a student is, not the distance to grade level.
